i need the CW narrow mode for Straight Key Century club events - which is when have a good reason to use the TS830 instead of the modern stuff.

recommendations on approach to fixing the loss problem? suggestions on where to probe/what to look for before I pull the IF board out to possibly replace the filter?

I forgot to mention that some people use a 1k pot in series with input and 1k pot in shunt with output and adjust the pots for minimum amount of ripple.

To be more precise would also place 15pf capacitance in shunt on each side, but I have never done that as my objective has been to make sure no gross failure or change in a used filter.

I have found a couple where Fc had shifted, but for most part I have had good luck buying used pulled KW hybrid filters for all the models.

Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by me, WB0IQK. There were
26 stations checking in under good
conditions. There was 5 new station checking
in, WD9FUM, KF6VBJ, WB2PAY, N9LOT, and WB4H.

We had the following number of radios checking in.

5 running TS-520(x)
3 running TS-530(x)
1 running TS-820(x)
5 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830s + Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
13 stations checking in under good
conditions. There was 2 new station checking in KK7VY, and N0KJB.

We had the following number of radios checking in.

3 running TS-520(x)
2 running TS-530(x)
2 running TS-820(x)
1 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and

TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

Helllo all,

Question on my 820S, when I'm on 15m my display is always stuck on 9mhz all other bands are fine. Is this a band switch problem or a DG-1 boards problem?

Thanks

Rory

53822. Re: [TS-520_820_530_830] 15m digital readout

Rory,
It could be either. When the display reads 9.000mHz on 15M, does the rig receive or not? Is this a new to you rig?

I suggest you obtain a Service Manual, and look at Pg 40.
Good copies of the 820S Service Manual can be found at:
w0nta"dot"com
wb4hfn"dot"com w5rkl"dot"com n6wk"dot"com

All the above are group members and supply tons of info free of charge. Also, you might want to take a look at: K9tw"dot"com also.The group also has quite a nice "files" section accessible from the home page. Also, from the home page you can search the "conversations" area about your problem.

Hi,

It's been a longer delay than I originally intended, but I now have a good supply of black Kenwood switch handles.

I have two listings on Ebay for these:

Single Pieces, either Black or Grey - Listing No. 262234502756

Set of Five, any mix of Black or Grey colors - Listing No. 262234505472

Let me know if you have any questions.

Regards,

John

The DG-1 get input from VFO, Carrier and HET frequencies. Since I assume it works ok on the other bands, the difference would be the HET oscillator. I know from experience that the DG-1 on the 820 can be sensitive to oscillator levels. Something to consider is checking the output level of the 15M Het oscillator, and the input level to the DG-1 with a scope. Checking 15M HET alignment would be a starting point.

The DG-1 is sensitive to dirty connectors. Dirty switch contacts can also cause problems.

No, those switches are not the 120/240VAC power select switch. The 120/240VAC rear panel switch with tab is much larger than the front panel switch tabs.

Cut and paste the eBay ad number onto eBay's search text box then click search. The ad will come up.

I think you are confusing the DG-5 with the DG-1.

There is no VFO or Het Osc input to the DG-1 Counter Mixer board. The RF signal voltages to the Counter Mixer come in via a 17 pin Molex Conn. 8mhz Carrier Osc (CCR) at Pin 7 should be approx 50mv rms. 30mhz VCO (CVC) at Pin 1 should be approx 150mv rms. Both can be measured with an RF millivolt meter or an O-scope.

The Het Oscillators are crystal controlled Colpitts configured oscillators on the PD board. There is no way to do any kind of "Het Alignment". No adjustment to pull the crystal frequency and no adjustment for rf output level. The Het oscillators are part of the mixing scheme that produces the Phase Correction (PC) voltage for the VariCap line on the VCO board.

It is possible to have a bad Het Osc but it is not common. When that occurs most likely is due to bad solder at the crystal pins or bad crystal. Again not very common.

Kind of a pain but can measure Q6 26.5mhz 15 meters Het Osc output at TP-4 on the PD board. I wouldnt reach for it until validate that CVC to the Counter Mixer board is missing.

I would start troubleshooting by pulling the DG-1 Unit and remove its shield can and with rig on its side plug it back in to the 17 pin connector. I would also connect a temporary alligator ground jumper from its chassis to the main chassis. I would then measure CCR and CVC with the VFO set at 21.200 mhz. I have spare display tubes, but if no spare can remove the installed one and plug it into the removed DG-1 so can observe the digits.

I would also measure B3 at Pin 10. It should be approx 8.3vdc. B3 provides the LP Filter switching diode forward bias on 15 meters. If it is missing then there will be no Cin signal to the Display board. I would measure Cin and it should range from approx 800mv to 1200mv rms. If Cin is very low or missing then measure at TP-4 on the Counter Mixer board. Should see approx 100mv to 150mv rms. It will be dirty (harmonic rich and may be difficult to sync on the scope). If your scope has filter capability configure it for a LP filter with cutoff around 25mhz. Will then have nice clean signal to measure at TP-4. If have good signal at TP-4 and no signal at Cin then you know that B3 LPF isnt turned on. Can confirm that further by measuring at TP-5 at the output of LPF and should have good clean signal there approx 75mv rms. If signal missing at TP-5 then it is due to missing B3 8.3vdc bias or bad D5/D6 filter switching diodes. Not common to have bad diodes.

If you have normal Cin signal level on 15 meters then I would do the regular solder reflowing on all the plated thru holes which has been addressed here numerous times. As well as cleaning the both sets of the Intra-board molex connectors.

As to signal levels if the Carrier level (CCR) is found to be at 100mv at Molex pin 7 readjust to 50mv. If it is at that level most common display error is very erratic display most prevalent on 10 meters. The service manual incorrectly calls out 100mv.

I forgot to mention that Cin will be at 22.200mhz or 1mhz higher than the operating frequency. Cin (Counter Input) frequencies can be found in the chart on Page 73 of the Service Manual along with the corresponding VCO (CVC) frequencies. It isnt critical, but I would do the 15 meter measurements in USB mode.

If the "birdie" at 21.200 bothers you just move down to 21.175mhz. Cin will then be 22.175mhz instead of 22.200mhz. Level of 800mv to 1200mv rms will be the same.

Subject: [TS-520_820_530_830] TS530S : Trouble to tune TX

Hi all,

With the help of the group I could fix my TS530S on RX. Now I tested it on TX. I get HV, IP, ALC values which seem correct but the plate tune is not at the expected band indication, quite far away on some bands, even out of written range. The output power is not as expected too (30-40W), and the dips look not so deep than before.

In the RX fixing process, I had to change the band switch shaft which got loose and broke. I tried to put it back in the original position but I have a doubt about it.

Can anyone tell me how to be sure that the band switch axis is aligned on both the foreground part (RF board) and the background (final cage)?

Thanks for your help, hapy new year to all,

73 de Jean-Louis F5DYD

Mike,

This is from a post by Mike W5RKL explaining how to align the band switch shaft coupler after replacement. The 530 and the 830 are almost identical in this regard, so this procedure should work in either (I have done this is both 530S and 830S units). I believe the 830M would be the same, as I recall it is the nearly the same as the 830S but set up to run limited output power for the Japan market (one 6146B/2001A final tube if I recall correctly). Read this over carefully and have a close look at the rig to be sure. This is the best written description I have seen for this procedure.

Good luck & 73

Dave K3DWB

Subject: Re: [TS-520_820_530_830] TS530S : Trouble to tune TX

Jean,

Remove ALL power, let the 530 sit so the power supply filter capacitors have discharged to zero.

Remove the top and bottom covers.

Remove the final amplifier cover.

Remove both 6146 tubes.

You will have to loosen the coupler between the RF Unit band switch long shaft and the band switch shaft inside the final amplifier.

Do NOT pull/remove the long band switch shaft from the RF Unit switch wafers!!! It's okay to pull the shaft back just enough to remove the bad cracked coupler.

The shaft on the band switch "inside" the final amplifier has 2 flat spots, 90 degrees of each other. See the following picture to see the flat spots on the final amplifier band switch:

The arrow in the picture below is pointing to the final amplifier band switch coupler that cracks. The shaft on the band switch the arrow is pointing to has the 2 flat spots shown on the picture above.

Rotate the band switch inside the final amplifier so the flat spots are at the exact locations indicated below.

1. Rotate the final amplifier band switch shaft so one flat spot is exactly "vertical" and facing the right side of the final amplifier where V1 6146 is (front 6146).

2. The other switch shaft flat spots should now be facing directly down at the chassis (exactly horizontal).

Make sure the flat spots are oriented exactly as stated above.

Install the new coupler and slide the long shaft into the coupler.

Do not tighten the coupler set screws.

Rotate the front panel band switch so the band switch knob is pointing exactly at "10" (30 meters), NOT 10 meters!!!

Verify the above settings. If all are as stated, tighten the coupler set screws. You are done.

Replace the 6146 final tube, final amplifier cover, and both top and bottom covers. Test the radio for proper operation.

73

Thank you for that Dave but the 830m is actually the same as the S but with am and as i said in the original post the fix from the group assumes that there are two flats on the short shaft and on this one there are three. I am looking for someone who has come across this before and can tell me which two to use for set up. 73 de Mike M0MCY

  Mike,This is from a post by Mike W5RKLexplaining how to align the band switch shaft coupler after replacement. The 530 and the 830 are almost identical in this regard, so this procedureshould work in either (I have done this is both 530S and 830S units). Ibelieve the 830M would be the same, as I recall it is the nearly the same asthe 830S but set up to run limited output power for the Japan market (one 6146B/2001Afinal tube if I recall correctly). Read this over carefully and have a closelook at the rig to be sure. This is the best written description I haveseen for this procedure.Good luck & 73Dave K3DWB Subject: Re: [TS-520_820_530_830] TS530S : Trouble to tune TX

Jean,

Remove ALL power, let the 530 sit so the power supply filtercapacitors have discharged to zero.

Remove the top and bottom covers.

Remove the final amplifier cover.

Remove both 6146 tubes.

You will have to loosen the coupler between the RF Unit band switch long shaft and the band switch shaft inside the final amplifier.

Do NOT pull/remove the long band switch shaft from the RF Unit switch wafers!!! It's okay to pull the shaft back just enough to remove the bad cracked coupler.

The shaft on the band switch "inside" the final amplifier has 2 flatspots, 90 degrees of each other. See the following picture to see the flat spots on the final amplifier band switch:

The arrow in the picture below is pointing to the final amplifier band switch coupler that cracks. The shaft on the band switch the arrow is pointing to has the 2 flat spots shown on the picture above.

Rotate the band switch inside the final amplifier so the flat spots are at the exact locations indicated below.

1. Rotate the final amplifier band switch shaft so one flat spot is exactly "vertical" and facing the right side of the final amplifier where V16146 is

(front 6146).

2. The other switch shaft flat spots should now be facing directly down at the chassis (exactly horizontal).

Make sure the flat spots are oriented exactly as stated above.

Install the new coupler and slide the long shaft into the coupler.

Do not tighten the coupler set screws.

Rotate the front panel band switch so the band switch knob is pointing exactly at "10" (30 meters), NOT 10 meters!!!

Verify the above settings. If all are as stated, tighten the coupler set screws. You are done.

Replace the 6146 final tube, final amplifier cover, and both top and bottom covers. Test the radio for proper operation.

73

Interesting, Mike! I'm out of ideas-mine was set up just like the post from Mike W5RKL. I pulled out the Service Manual and there's nothing in there I can see that gives a clue. There are techs on this board with way more experience that me, so maybe they have seen this and will comment. Good Luck!

Dave K3DWB

PS I figured out about the AM feature for the "M" model after pulling out the manual. Sometimes my recall fails me: I was thinking of the TS-530D

Regarding my Kenwood TS530S

I had the same problem with the band switch. Not knowing your procedure, I used an MFJ 269 as a dipper and was able to determine the position that way. My dip coil didn't fit inside the tank coil so I wound a smaller one that fit into the coil. Then it was a simple matter to turn the switch until the dipped frequency matched the dial properly. I ended up using
the coupler for the load capacitor in the finals box and installed one from my junk box in the load capacitor. At any rate, it accomplished the same end and is working fine now.
I don't know if parts are available for this vintage stuff so had to make do with available resources.

Topic: 53839 Message: 53839

Hi, friends,

my TS820 has a high white noise on bands over 20 m, and not so good sensitivity.

I have done the aligment procedure from the service manual (pack coil board and IF board) and the noise continues being so high.

On 160, 80 and 40 m the sensitivity is better and the white noise in on background.

Doing the aligment using the marker 25KHz signal and S meter indications, from bands bellow 20 m is S7, but on 20m S4, 15 m S2, 10 m S1.

What to do?

Thanks. Jose

I opened my TS830 and sprayed the contacts on the band switch with DEOXIT D5 & I oiled the fan motor. NOTHING MORE! I buttoned up the radio & hooked up the antenna etc. I turned the band switch and got no response from the digital display. I turned the main tuning dial & no response on the digital display. I turned off the radio & turned it back on and the digital display was move to the new freq. HELP

In addition to that, have you recently converted to some cheap Chinese LED bulbs or had a solar system installed where the inverter might be radiating? If so, try turning off what you can and see if the noise level changes for the better.

George,
The cable you need to make the connection between your TS-530S and AL-811H amplifier can be purchased on eBay for $16 (free shipping).

Cut and past eBay ad number 291094867300 into eBay "Search" box and click "Search". The ad will come up.
This cable is prebuilt so you do not have to mess with obtaining the cable, 7 pin DIN plug, and all the connecting and soldering required to make the cables.
The cable, when properly connected to the AL-811H and TS-530S, provides relay switching AND amplifier ALC control to the TS-530S transceiver.

Simply insert the 7 pin DIN plug into the TS-530S rear panel's "REMOTE" DIN socket. You will find the location of the "REMOTE" DIN socket in "Fig 3-2 Rear Panel View" on page 12 in the TS-530S Instruction Manual.

If you do not have the TS-530S Instruction manual then I recommend you download it at the following link (Free downloading):

http://w5rkl.com/wp-content/uploads/2014/04/Kenwood-TS-530SP-manual.pdf

If you do not have the AL-811H Instruction manual, you can download it at the following link (also free downloading)

I highly recommend you spend time reading both manuals before you attempt to operate the TS-530S with the AL-811H amplifier.

You would be surprised at the many "Operator Errors" as a result of operators who failed to read, for what ever reason, the equipment's Instruction manual(s). Don't be one of those operators, spend time reading the manuals. If you have questions about anything you do not understand, don't "ignore" that area, come here and ASK for help.

OK if TX and RX are normal as you report then you are not losing the VFO signal to the PLL board and not losing the VCO signal to the RF board where it serves as the LO for the TX and RX Mixers.

If Digital Display is blank the most common problem is that the PLL is unlocked. When this occurs wont have any RX or TX. In addition to dirty FIX switch contacts another possible cause is dirty S21 switch. Also dirty air variable capacitor rotor shaft wiper contact in the VFO. Normally can tell this if this is the source as Display will come and go as you rotate the VFO knob.

If no RX and TX try cleaning and exercising the S21 Mini Din switch in the Ext VFO jack on rear panel. Best if you have a spare DIN plug or remote VFO cable that you can insert in and out of the jack to toggle the S21 switch to wipe the contacts.

Since you report "normal" RX and TX then sounds like it is a display problem and not PLL problem. Try gently wiggling and pressing on the Counter Unit Board Molex connectors to see if Display comes and goes. If so carefully unplug and clean with Deoxit and reinsert.

When you say that RX and TX are "normal" you are telling us that with the Digital Display blanked you have normal receive and normal transmit functions? Is that correct?

George, I have a 520se and an 811. I hooked up pin 1 (ground) and pin 5 on the 8 pin plug to the phono plug. Use shielded cable. Then hook your coax from your 530 out to the input of your 811h and your coax to the antenna to the output of the 530. You can insert your wattmeter to the output of your 811h. Hope this helps.

Thanks Mike,
I have enjoyed running the 530. I have an Icom 7410, but just being able to use the hybrid is so much fun.

I have found that I use the 530 on mostly 75 for local net work, and the other for Everything else.

Thanks for your help. I am going to order a cable..'

You're welcome George. Naturally you would need a short coax jumper between the TS-530S and the amplifier's "RF IN" SO-239. The antenna is connected to the amplifier's "RF OUT" SO-239 socket.

I have an AL-811 (3 tube) amplifier. I don't use it that often, only when band conditions warrant its use. Many hams today use an amplifier whether band conditions warrant its use or not.

Enjoy.

David and others,

A licensed Amateur Radio operator who is a member of this group has the "option" of including their call sign with their name in their message signature. This is clearly stated in the group's policy file. I cut and pasted below, that section of the group's policy:

/*"If a member does not wish to include their Amateur Radio call sign in their signature then simply use their first name ONLY, same as non-licensed members."

*/This signature policy has not changed since the rules were upgraded in early 2015 and posted on the group's home page File section in December 2015.
/**/
The current Group policies can be found on the Yahoo Kenwood TS_520_820_530_830 Home page in the Files section under the "AUTOTEXT MSGS" folder and in the file named "Message on Approved Membership.txt". The same policy message in "pdf" format can be downloaded from the following link:

http://w5rkl.com/wp-content/uploads/2015/02/Message-on-approved-membership.pdf

Mike and Joe,

A number of groups I subscribe to have a monthly reminder regarding policy and behaviour.

It may be worth investigating a regular reminder explaining the requirement for adding name and callsign. Don't make it a message with an attachment or a link saying "read here" because many people don't bother, rather put the instructions in plain text with a supplementary link which people "might" read if they need more information. I know everyone gets a reminder when they join and it's on the front page of the group and in the files section and on a link to Mike's website but clearly some folks aren't getting the message. A regular message might actually help reduce the reminders you guys have to give out.

Thanks Luther,
I think that the one on e'bay, you can just plug in and go. Nothing else to do. About 16.00 for the cable.

Have you followed the instructions in the TS-830S operator's manual, page 19, under paragraph title
(1) SSB OPERATION
where, after properly tuning the transmitter, the MIC gain control is adjusted for an indication on the ALC meter in side band transmit?

The VOX GAIN has nothing to do with normal sideband voice transmission. VOX GAIN control, varies the level of audio from the speech amplifier to the VOX circuit. Basically the VOX GAIN control is a "volume control" for the VOX circuit.

I forgot to comment about the microphones.

What make and model microphones are you using?

The Ts-830S has a microphone impedance range from 500 ohms to 50K ohms. A couple of microphones that work with the TS-830 are

Shure 444
Non-amplified Astatic D104 (with a good element)
Kenwood MC-50

It quite possible an original D-104 microphone element can easily go bad over time (age) resulting in very little, if any, audio output from the microphone element. Improper or broken/modified microphone wiring can also result in loss of microphone element audio to the radio.

Not paying attention to the microphone grounds on the 4 pin microphone socket and plug can lead to microphone audio problems. Hum can easily be found on microphone audio if improper grounds are used. The microphone wiring shown in the operator's manual should be followed.

If you have a scope you can test an old D-104 mic element. Simply set the scope for a very low input voltage, set the scope to display "AC" voltage, set the scope probe to x1, then connect the scope probe across the microphone element terminals. Either speak in a normal voice level or whistle in a normal level about an inch or so from the mic element. You can also use a tone from the radio's speaker with the mic element held within an inch of the speaker, as an audio source. Either way, if the mic element is good you will see a good audio signal displayed on the scope. If the mic element is bad then the audio signal on the scope will be very very low or none at all.

If the microphone contains an "Electret" element then that microphone will not work with the TS-830S without a DC voltage applied to the Electret element. "Electret" element require a DC voltage to power the mic element. The DC voltage is typically provided by the radio through the microphone socket and cable.

53861. 830 mode switch wiring and other issues

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-01-20 21:31:04 UTC
From: km4puw@...
Topic: 53861 Message: 53861

Thanks in advance the help:

I have, on the advice of a friend, installed a new mode switch on my 830. Result, now I have no "static" audio on LSB. I know that the LSB is on the pll connector 8 pin 4, but this wire go directly to the mode switch? I have obviously miswired the mode switch, or left a wire off. Does anyone know what color that wire is so that I may trace it down.

In addition, the other night I discovered that the radio would transmit in cw only with about 60 watts across the K4EAA dummy load, and tx on cw only. Shortly thereafter it blew the cathod resistors. I have replaced the cathod, screen and R15 and R16 resistors. Now I have no tx at all on any band. What else might have blown when the cathod resistor went? Why does it only tx in CW mode in the first place.

Trying to learn on this abused 830 that was on its way to the dump. Any help would be appreciated.

I worked out the no lsb, solder short, alot of work because of late night playing with radios instead of sleeping. In addition, or maybe because of the other issues, I have now discovered that I have no SG voltage. It never ends. At $10/hr I could have bought three of 830 working condition. But where is the fun in that.

Jeff,
The Final Amplifier's Screen voltage (final unit SG terminal) comes from the Rectifier Unit's "210A" supply. You should start at the Rectifier Unit's "210A" terminal and work your way towards the Final Unit's "SG" terminal.
The Rectifier Unit's relay "RL1" is a simple SPDT switch that is controlled by the rear panel "SG" switch.
SG switch in the "OFF" position "energizes" Rectifier Unit's RL1 relay, applying a "negative" DC voltage from the Rectifier Unit's "-C" supply to the Final Unit's "SG" terminal and ultimately to the 6146 screens, pin 3.
SG switch in the "ON" position "de-energizes" Rectifier Unit's "RL1 relay, applying normal "positive" DC voltage from the Rectifier Unit's "210A" supply to the Final Unit's "SG" terminal and ultimately to the 6146 screens, pin 3.
If you have loss Final Unit "SG" voltage then i recommend you start at the Rectifier Unit's "210A" terminal first, this is the "210A" supply output to the final amplifier through the "MODE" switch.
I have a high resolution TS-830S schematic you can download from my website. I recommend you download it and use it to trace the SG wiring from the Rectifier Unit to the Final Unit in your TS-830.

Thanks Mike, I changed the screen resistor again, and magically I now have SG voltage. Maybe a bad resistor, maybe I didnt solder it very well, although I have never seen a bad new one in my limited experience. Anyway, after changing that out I now have SG voltage, but it will still only transmit in cw mode. It has gotten the best of me. Any ideas are appreciated. By the way when in TX's in CW mode, the frequency jumps up or down depending on the XIT(?) knob setting. Regardless as to weather the button is on or off. FYI. In addition, when the VOX is activated, with or without a microphone attached, it automatically switches to TX.

FRUSTRATING!!

SG switch

in the "ON" position "de-energizes"

Rectifier Unit's "RL1 relay, applying normal

"positive" DC voltage from the Rectifier

Unit's "210A" supply to the Final
Unit's

"SG" terminal and ultimately to the 6146
screens,

pin 3.

If you

have loss Final Unit "SG" voltage then i
recommend

you start at the Rectifier Unit's "210A"

terminal first, this is the "210A" supply
output

to the final amplifier through the "MODE"

switch.

I have a

high resolution TS-830S schematic you can download from
my

website. I recommend you download it and use it to trace
the

SG wiring from the Rectifier Unit to the Final Unit in
your

TS-830.

Thanks Mike, I changed the screen resistor again, and magically I now have SG voltage. Maybe a bad resistor, maybe I didnt solder it very well, although I have never seen a bad new one in my limited experience. Anyway, after changing that out I now have SG voltage, but it will still only transmit in cw mode. It has gotten the best of me. Any ideas are appreciated. By the way when in TX's in CW mode, the frequency jumps up or down depending on the XIT(?) knob setting. Regardless as to weather the button is on or off. FYI. In addition, when the VOX is activated, with or without a microphone attached, it automatically switches to TX.

FRUSTRATING!!

Jeff

KM4PUW

Jeff,

The Final

Amplifier's Screen voltage (final unit SG terminal)

comes from the Rectifier Unit's "210A"
supply.

You should start at the Rectifier Unit's

"210A" terminal and work your way towards the

Final Unit's "SG" terminal.

The

Rectifier Unit's relay "RL1" is a simple
SPDT

switch that is controlled by the rear panel
"SG"

switch.

SG switch

in the "OFF" position "energizes"

Rectifier Unit's RL1 relay, applying a

"negative" DC voltage from the Rectifier

Unit's "-C" supply to the Final Unit's

"SG" terminal and ultimately to the 6146
screens,

pin 3.

SG switch

in the "ON" position "de-energizes"

Rectifier Unit's "RL1 relay, applying normal

"positive" DC voltage from the Rectifier

Unit's "210A" supply to the Final
Unit's

"SG" terminal and ultimately to the 6146
screens,

pin 3.

If you

have loss Final Unit "SG" voltage then i
recommend

you start at the Rectifier Unit's "210A"

terminal first, this is the "210A" supply
output

to the final amplifier through the "MODE"

switch.

I have a

high resolution TS-830S schematic you can download from
my

website. I recommend you download it and use it to trace
the

SG wiring from the Rectifier Unit to the Final Unit in
your

Thanks, I figured that out eventually. On to the issues. I have done the bandswitch repair, thinking that might be the problem with the receive. It now transmits I have not mentioned that. Forgive me for this, but, I drilled a small hole in the back of the mode switch (the blue one) and sprayed dexoit in there, worked the switched generously, turned it upside to let it drain overnight. Blew it out with compressed air, and WOLAAAA, it transmits in all modes now.

Now to the receive, did the bandswitch repair, and comfident that is all aligned properly, finally. Still no receive, Tuned to the local AM broadcast station, strong station for me, 1510, and if I touch the top of the 3rd wafer (3rd I believe) with a metal object in my bare hand, it receives that station. On other bands the static gets louder but have not received any signals. By the way, don't touch the last wafer with a metal object in your bare hand!!!!! Most certainly dont pee on it!!!

The groups help is always appreciated.

Thanks guys. I would try the viagra on it, but afraid it would get a headache afterwards. I got the radio to transmit by cleaning the mode switch. I drilled a small hole in the back of it and sprayed in some deoxit. Still no recieve but I did discover that if I touch the top of the wafers it will receive a local am broadcast station. By touching in one with a metal object in bare hand the receive seems to improve on all bands, static background noise increases, and like I said I could hear the am station at 1510. DON"T touch the last wafer by the way, and certainly don't pee on it!!!

FYI, when attaching an antenna you can generally hear some static scratches let call it. I get none of that either. I have completed the K4EAA bandswitch repair and cleaning and am confident that all is aligned and back together properly.

Help is always appreciated.

Jeff,
I don't know what you are attempting to clean using contact cleaner sprayed through a hole you drilled in the rear panel. Do not spray contact cleaner haphazardly through a hole you drilled in the rear panel!! That's clearly the wrong way to use contact cleaner.

Hello everyone,
I have a display problem and I will try to say what the problem as close as I can.
The radio works fine in every way but this problem.
The last digit to the far right (as you face the radio) stays on " 0 " and doesn't count when moving the dial.
The second digit from the far left (again viewed from facing the radio) does the following :
on 10 meters it reads 0 in place of the 8 when using 28.XXX and 1 in place of the 9 when using 29.XXX
on 15 meters it works correct.
on 20 meters it has 0 in place of the 4 for 14.XXX
on 40 meters it has 3 in place of the 7 for 7.XXX
and for it works fine.

Anyone have an idea where to start on this problem ?
Thanks
Ron N7ESR

How else would you get contact cleaner to the contacts on the mode switch? Like I said, it did in fact work. I believe that the method is sound. I allowed the switch to drain over night and blew it out with compressed air the next morning.

How did you keep aluminum shavings from entering the last switch deck as you drilled thru the riveted on aluminum back panel of the Mode swithc? Not a good plan and certainly not first step or common step in troubleshooting no or low Rx.

If you have no RF sig gen to perform signal injection method of troubleshooting you can bare hand touch on the "S" solder lug of VC-1 capacitor. The "S" lug is the small set of plates. Touch on 40 meters for starters. Can also touch there with the center pin of your PL-259 connector on antenna feed line. Even couple of feet of wire like an alligator jumper will result in off air signal copy.

If you get good Rx at "S" lug then move back to TP-1. If no Rx when touching at TP-1 then likely the L41 Ant Step Up transformer is bad. Contact Jan N8CBX as he may have a rewound one he will sell you.

If good RX touching at TP-1 then keep moving back the signal path toward the SO-239 connector (use the schematic). Could be bad dirty molex connectors, bad RF attenuator switch, bad Ant TR relay contacts etc.

It is very easy to troubleshoot no RX if you use signal injection/tracing method.

I am afraid that ignorance is plentiful here. How do I verify the audio stage? For drilling the hole I used a sharp upcut endmill, 1/32" under high vacuum, then I said a little prayer to any supreme being that is into ham radio repair. Thank you for the suggestions and the contact for the rewond l14. Will let you know. I noticed on your website that you mention and a bad transferter din plug. When I got the radio that plug and been removed, just dangling there, I suspect that now I know why. Any idea as to the proper wiring of this plug and/or where to find a replacement for that?

To verify the Audio Stage is working with no test gear go to the Audio Board and locate Molex Conn 1. Insert a hobby floral arrangement pin or safety pin or straight pin into No. 2 DET position and then touch bare shaft of the pin with your fingers or clip a alligator or mini-grabber test lead on it and touch the bare end of the test lead.

You should hear a nice hum in the speaker and should be able to vary the loudness in the speaker with the AF gain pot. If you can do this you just proved that the audio pre-amp stage, AF gain pot and associated molex connector, the Audio Output amplifier, associated molex connector, the speaker, and the headphone jack are all good.

That tells you if there is recovered audio available at the output of the Product Detector and it arrives at the DET terminal on Audio Board Conn 1 you will hear it in the speaker.

Some folks work backwards from the Audio stage to the Product Detector to the IF amps to the Front end. I usually work from Front end toward the AF Amp as more common to have issues at the Front end.

Always want to revisit any work you do when radio doesnt work after performing that work. Very easy to make a mistake especially when many lead wires involved like Mode switch replacement. Mode switch very seldom fails but does quite often cause scratchy sounds in speaker when the switch is being moved. This is especially true if the radio has set idle for long time. Often getting some heat into the radio and multiple exercising the Mode switch will cause the scratchy/noisey operation to improve or completely clear up. .

I forgot to comment about what I think you said was the reason you changed out the Mode switch.

I believe you said that in LSB position you had no receiver back ground noise. Does this mean you had background noise in USB position of the Mode switch?

If that is the case your first step should have been to verify that you had an operational LSB Carrier Oscillator. You need 9vdc supplied to switching diodes to place correct crystal in the oscillator circuit.

The Mode switch supplies that 9vdc bias to the PLL board. Should confirm you have 9vdc at Molex Conn 8 Pin 4 Brown wire when the Mode switch is placed in LSB position.

With Mode switch in Tune, CW, and USB should have 9vdc at Pin 5 Yellow Wire to turn on the USB Carrier Oscillator.

If the Carrrier Oscillator isnt turned on then you wont have any CIO (Carrier Insertion Oscillator or BFO for the old timers) for the Product Detector and will have no Rx. This is an unusual failure.

If you find you have no 9vdc to Pins 4 or 5 at Conn 8 on the PLL board you can temporize this using a 9vdc transistor radio battery to see if the receiver comes alive. If so, will need to go back and recheck Mode switch wiring.

Might want to ask Walter Dilley if he can supply you a switch with as long a lead wires as he can salvage so that you can butt splice into your harness.

Since I used a brand new TS-520 as a brand new General back in the mid-70s, I thought it would be fun to buy two or three and and completely restore the best of the lot and use it on the net every week. The "two or three" turned out to be five of them .

So I picked out one of them that looked pretty clean and thought I would make it my 'trainer' project for cleaning, alignment and re-capping. Its original problem was low drive which a good 12BY7 completely cured. I think it also had a problem of not being able to tune up on the low bands but I thought contact cleaning, alignment and re-capping the big boys would eliminate the problem.

What I've done so far:

- installed good 12BY7
- installed new finals, tried another set
- did a complete alignment with no drama
- replaced screen grid and driver caps and all of the large electrolytics
- replaced cathode and final screen resistors
- installed the final cage repair kit (doorknob caps, the .01 2kv ceramic and the RF choke)
- checked power supply voltages

I have good drive on the low bands with a nice peak. I just noticed I got a poor dip in plate current on 40 meters with the plate control at the 3:00 o'clock position, no more than 25w out.

Another anomolie I've noticed is my Bird wattmeter will indicate 250 watts output on the bands (into a dummy load of course) on the bands where the rig will tune up. I don't see how than could be unless there's something funky going on with my Bird.

I am at wits end at this point as to what to check or where to go next. Help.

My testing days are over, I have nearly died twice today trying to fix this silly thing. I was just touching the test points, with what I thought was good success, then DAMN! One of those test points is not to be toyed with. I need to find a final cage cover, the one that says high voltage on it, and I will be sending the rig to you. As I type this the smell burnt flesh lingers in the air. I was trying to save a few bucks and get the school ham radio club up and running quickly, but it is not worth it until I am better read and understand the systems in this radio better.

I think I will just use my UHF and VHF radios with the club for the time being. When funds flow a little better I will send her along to you for your expert opinion as to whether or not the rig is worth fooling with. Thanks for all your help and patience.

Jeff:

There are no "Test Points" inside the PA cage and certainly nothing inside the PA cage that could be the root cause of no background receiver noise in the speaker.

If you make barehand contact with the 900vdc B+ while your your other hand is touching the chassis sheet metal you have established a hand to hand current path across your heart and you can put your heart into fibrillation and be killed. It sounds to me that you are very lucky.

I strongly recommend that you put the covers on the radio and stop your troubleshooting efforts. No shame in that.

In addition to the 900vdc B+ for the 6146 Final tubes there is also around 340vdc plate voltage for the Driver tube and 250vdc for the screen grids. Either one can provide a very nasty shock. Numerous places above and below the chassis deck where you can contact these voltages.

Suggest you go to my website www dot K9TW dot com and read my service policy. We need to take this off the forum. I will tell you that I am very busy and cannot promise you that I will accept your TS830 for service. I need to understand more about the radios history and what other work you have done in addition to changing out the Mode switch and drilling into its aluminum back plate. In my service policy you will find verbiage about radios that have been hacked and modified.

Again, please stop working on this radio and get the covers back on it.

OK I thought you were inside the PA cage?

TP-1 and TP- 2 on the RF board should have no voltage on them.

It is good safe work practice to always take a voltage reading with a known good voltmeter before barehand touching any point on any of the boards.

The only other TP on the RF board that looks like TP-1 and TP- 2 is TP-4. TP-4 has 12vdc on it.

My guess is you got on the top of R38 470K resistor just behind Molex Conn 10 near TP-4. R38 has Driver tube anode voltage of approx 340vdc on it and will give a nasty shock or worse. Also, you may have brushed hand against the last red/brown vertical bandswitch deck S1-7. All of its contacts have 340vdc on them. Not understanding the as-built configuration it is impossible for you to know where all the rattlesnakes are at. Studying the schematic and always taking a contact voltage measurement before barehand touching is only way to avoid shocks or worse.

Your HP8640B is overkill for most folks for just signal injection/tracing efforts, but a fine generator for troubleshooting and alignment of KW hybrids assuming it doenst have the cracked gears and bad contact finger issues. I have one that has had these issues addressed and it wasnt cheap.

I am sorry but very reluctant to help you use the 8640B to trouble shoot the radio. Perhaps someone else can step in here and assist you? My parting comment would be that you know that the Audio stage is working. With the 8640B you can test the IF chain by injecting 8.830mhz (RIF signal) into TP-2. At -73dBm level should see approx S5 S-meter indication. If receiver comes alive then you know that the problem is in front end and not on the IF board.

Before doing any signal injection work I would make sure you have 12vdc, 9vdc, and 3.6 RF-1 voltage from the AF board. If there is no AGC bus voltage at the IF or RF boards then will have no receive. AGC bus voltage measured with a 10meg to 11meg meter will read approx 2.6vdc and cause S meter to deflect upscale. If you turn the RF gain pot CCW the S meter should deflect up scale as it is monitoring the AGC bus voltage. If it doesnt peg up scale then may not have an energized AGC bus. This can be due to bad molex connector assuming that you have good RF-1.

OK against my better judgement I have given you more help than I should have. I dont want to be involved with anymore shocks or worse. I simply in good conscience cannot respond to anymore of your post. Perhaps there is a local club where you could find an old timer to coach and oversee your troubleshooting efforts? If you find that person and he or she has some questions I will consider responding to them off the forum.

Gday,

I do not work on the 20 series radio. However, based on your description I had a similar issues with a 530s, it ended up being the padder caps on s22, band switch in the pa cage. These are type 1 rf caps, usually 500v or 1kv. Due to their proximity to the tube, they tend to crack and go out of spec. Again I don't work on 20 series, so this is just a guide.

"bucket@... [TS-520_820_530_830]" <TS-520_820_530_830@yahoogroups.com> wrote:

Since I used a brand new TS-520 as a brand new General back in the mid-70s, I thought it would be fun to buy two or three and and completely restore the best of the lot and use it on the net every week. The "two or three" turned out to be five of them .

So I picked out one of them that looked pretty clean and thought I would make it my 'trainer' project for cleaning, alignment and re-capping. Its original problem was low drive which a good 12BY7 completely cured. I think it also had a problem of not being able to tune up on the low bands but I thought contact cleaning, alignment and re-capping the big boys would eliminate the problem.

What I've done so far:

- installed good 12BY7
- installed new finals, tried another set
- did a complete alignment with no drama
- replaced screen grid and driver caps and all of the large electrolytics
- replaced cathode and final screen resistors
- installed the final cage repair kit (doorknob caps, the .01 2kv ceramic and the RF choke)
- checked power supply voltages

I have good drive on the low bands with a nice peak. I just noticed I got a poor dip in plate current on 40 meters with the plate control at the 3:00 o'clock position, no more than 25w out.

Another anomolie I've noticed is my Bird wattmeter will indicate 250 watts output on the bands (into a dummy load of course) on the bands where the rig will tune up. I don't see how than could be unless there's something funky going on with my Bird.

I am at wits end at this point as to what to check or where to go next. Help.

Check the output and alignment of the HET oscillators. Use freq counter to check output of the rig. Sounds possible that you are getting odd mixer products due to improper mixing levels. The harmonics can fool your Bird.

You stated it was a 520. If its an S or SE you can check the oscillator outputs at the rear of the rig. If its a plain 520, you have to dig into the rig to get to the signals.

Date: 2016-01-26 08:29:20 UTC
From: aclundwall@...
Topic: 53892 Message: 53892

I wound up with my mom's TS-830 when she died about ten years ago. I've decided to see if I can get it running, so I can get back into ham radio. It's been sitting for the better part of 20 years.

I took the case off and blew the dust out, and cleaned the inside and outside of the case (my mom smoked, and it still stunk a bit). But I've not messed with any of the innards, other than look them over really closely to see if anything is loose/broken/burnt. I found nothing obviously wrong. The radio is, I think, completely original...including the tubes...and I think even the wire preventing TX on the WARC bands is probably intact, though I'd have to check! If it ever got clipped, my mom would have had her Elmer do it...she would never have gone messing around inside the case of the radio!

I don't have a proper antenna, so I've not tried to transmit...I've only tuned it using a dummy load. But this is what happens when I try to tune up: The first step, with mode set to Tune, meter set to ALC, is to peak the drive control. With the carrier all the way clockwise, the max I can get the needle to show is about 3/4 of the ALC scale. If I take more than 3 or 4 seconds to try and dial it in, I can see the needle begin to drop, like the power is falling off!

Then I set the meter to IP, and dip the plate. The lowest point (the dip) is about 20mA on the scale.

Next, mode set to CW, meter still on IP, re-dip the plate. Things start getting wonky here...moving the plate does not move the needle. So, any movement of the plate control leaves you wondering where you are...since it didn't move the needle, you have no way to know if you are back where you started or not, so you have to start over.

Starting over with the Load control up part way will result in the meter reading a higher value when you dip the plate. But even fully clockwise, the most plate current it will register is 100mA...not nearly the 225mA recommended on K4EAA's tuning instructions! And still, once you change the mode to CW and try to re-dip the plate, moving the plate control won't budge the needle!

Before starting the above tuning procedure, I made sure the bias current was set to exactly 60mA per the Kenwood TS-830 user manual.

From things I've read here and there, I'm wondering if the problem is that my driver tube has gone belly-up? I apologize if this has been covered before...I'm almost certain that it has! But I tried searching, with no luck! I'd sure appreciate any words of wisdom the group can offer. I'm getting all sentimental here, and I'd really like to get mom's radio working again!!

Thanks,
Art, W5ACL

Topic: 53892 Message: 53895

That is easily determined by simply watching the HV meter in transmit. If the meter drops to less than 600VDC while tuning the transmitter in TUNE mode then one of the HV filter capacitors is bad. However, I could be wrong but I suspect the driver tube is eak since ALC tends to drop off after achieving a peak ALC meter indication in TUNE mode.
Connect the 830 to your 50 ohm dummy load.
Set the meter switch to IP, MODE switch to either USB or LSB, it doesn't matter, MIC gain fully CCW, then flip the SEND switch UP.Adjust the rear panel's BIAS pot for 60ma IP meter indication. If meter indicates instability when adjusting the bias pot then the bias pot would need cleaning.
Flip the SEND switch DOWN, unkey the transmitter.
Set the tuning controls, Mode switch, and meter switch for transmitter tuning as follows:
LOAD control fully CCW to it's physical stop
PLATE control so the knob pointer is pointing within the band switch setting's silk screen writing on the front panel next to the PLATE control
CAR control set to 12 o'clockDRIVE control set to 12 o'clockMETER switch to ALCMODE switch to TUNESEND switch flipped UP (keys transmitter)Adjust the DRIVE control for a peak meter indication. If meter pegs fully to the right, rotate the CAR control CCW for a 12 o'clock meter pointer indication and continue adjusting the DRIVE control for a peak meter indication. No scales are used at this point.
Leave transmitter keyed in TUNE mode for a second or two more and watch the ALC meter. If the meter starts to drop back towards zero then the driver tube is most likely weak and needs replacing.
Following the normal tune up instructions in the TS-830S Instruction manual.

53898. VFO 230 power transformer voltages

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-01-28 15:27:28 UTC
From: John Rouse AD5CO
Topic: 53898 Message: 53898

Hello,

Does anyone know what the no load output voltages are on the VFO 230 power transformer, I'm thinking mine is kaput.
Power supply has had all the caps, most of the transistors, regulator and a couple of diodes replaced, Been pulling my hair out, what little I have left trying to get it working and can't seem to obtain the correct output voltages. Turning it on, I get scrambled numbers till I switch between main and rotate the dial and back to VFO and rotate the dial, then the dial is
back to normal. Checking the memory channels, #1 comes up L36 and 2 through 5 are scrambled, also there is 100 khz higher difference when connected to my 830.
Any help would be greatly appreciated.

Thanks
John

Hi, friends,

the white noise is present even if the antenna is disconected.

I have compared this radio with other with the same antenna, one near other. The sensitivity of both is ok, but TS820 has this "white noise" (shiiiiiiiiiiiiiiiiiiii) over the signal.

I am thinking it could be misalignment in one bloq, manybe in the audio bloq.

Jose

Hallo John,I have recently been working on the VFO230,I had a number of problems with the PSU.
First take a look at the PSU schematic,you should have 18-24v DC on C2,this will be the larger of all the electrolytic caps on the board,you should see around -24volts DC on C15,15-16 volts DC on C4,and the same voltage on C11.
C7 you will see 5V DC which is the output of the 5 volt regulator,C12 you will see around 12volts,RL2 should be energized you can check this on D7 anode,sometimes the contacts of this relay will be dirty causing spurious brightness on the display.
If any of these basic voltages are not there then trouble shoot the voltage at C2 first,if low either the transformer , the diode components or filter capacitors may be at fault,this all assumes that the DIN cable is connected to the VFO and is sound,however one of the biggest problems on the PSU was cold solder joints,I found at least a dozen in many parts of the board,be careful not to over heat the PCB traces as they separate from the board very easily,also if you detach the PSU from the main unit make sure you ground the PSU to the main board,the ground is broken when the board is unscrewed from the main assembly,hope this helps any further questions please ask,

No internal adjustment. Not a DSP menu driven radio.

You would have to play with the individual RC time constant components and have to be careful when doing that so you dont end up with rough/raspy sounding audio on strong signals. Also, the attack times are staggered including delay to the RF amp. All of this is designed to prevent servo loop instability.

Depending on what TS830S model year and what REV IF board is installed you more than likely will have different RC values as KW engineers kept making "improvements".

Two AGS (slow) components you can play with are R200 and C177. Most commonly should find 10k ohm and 1.0uf. Another problem is having to plug and unplug molex connectors repeatedly to remove the IF board to make RC changes and risk inducing a cracked trace and/or lifted pad.

Some people hang different caps off the AGC bus. A 0.22uf is most commonly found. That can be done without removing the IF board.

Personally I would leave well enough alone.

How long does it take for messages to show up? Does every one have to be approved by the group owner? I replied to my thread several days ago and haven't see the message posted. Yahoo Groups leave a lot to be desired.

In answer to your question: Upon acceptance to this group, your were electronically sent a copy of the group policy/rules. It CLEARLY states that: all new members are "moderated." This means that your posts/msgs MUST be reviewed by either a co-owner or moderator, and either approved or rejected. How much time you are moderated, depends on YOU. If you abide by the group/s policies/rules, your moderation time will be short, and also, the opposite is true.

ALL posts/msgs are to be SIGNED PER GROUP POLICY, NO EXCEPTIONS. To assist you, this is what it means: put at a minimum, your given/Christian/first name at the end of every post/msg..no exceptions. IF your are a Licensed Radio Amateur, please include your call(not mandatory- but nice).
Even if your email header/address contains your name/call, you still must put a proper signature at the end of your post/msg. Screen names are not acceptable.

It's a sad fact, that the reason 99% of attempted post/msgs get rejected is, failure to read. The rules/policies are not ambiguous, nor are they designed to pick on a single person.

In this case "yahoo groups" are not at fault, failure to follow group rules/policies is.

You can set up "yahoo mail" and other mail programs to automatically add a signature at the end, thus avoiding getting your attempted post/msg rejected.

The group moderators & co-owners are doing this for free, and are not here 24/7/365. If the attempted post/msg meets group policy/rules, it can bee approved and show up in the group main msg area in a rather short period to time...sometimes just minutes, other times, especially major holidays, it could take 24+ hours. The group moderators/co-owners, actually have lives outside of this group.

Well I for one certainly appreciate the time you guys put into the group. I am an administrator on a large Jeep forum and a moderator on the oldest RV forum on the Internet and spend at least two hours a day taking care of forum business, 7 days a week.

So my status as a new member requiring moderation is subject to a judgement call by both of you two guys, or does one of you usually call the shots? Is there a rule of thumb that I can count on other than an admonition to behave for an unknown period of time and I'll be rewarded? I'm not trying to be snarky here, just trying to understand the process.

Maybe it would be easier on you guys if you granted post permissions after a set number of acceptable posts? Since I think the objective is to cut out the spam, I can't imagine a spammer hanging around for five or ten posts to slip a link in for a product.

99.9% of the spammers I deal with on the two forums are one event and gone situation, rarely do they try to spoof us with innocuous posts before they start spamming.

Kind regards es 73 de John, WB5THT

I believe you said that the plate current dip on 40 meters is occuring at 3:00. That would mean the indicator would be pointing just CW of the 28mhz position at the end of the travel arc. Is that correct? If so, that means that the plates of the Tank capacitor would be completely un-meshed. Not very likely that the fixed padders that are switched in shunt have actually electrically increased in value. More likely to be switching in the wrong padder. If the 390pf 160 meter cap was being switched in on 40 meter bandswitch position tank cap would have to be completely unmeshed to find resonance.

Did you remove PA cage cover and confirm that the plates are not meshed at the 40 meter 3:00 pm dip?

Do any of the bands have normal plate current dip at close to the white scribed indications on the front panel arc?

Here are some things to check:
1. Is the Tank capacitor coupler tightened properly and hasnt slipped letting the front panel indicator get out of sync with the actual degree of plate mesh?
2. Is the red/brown fiber coupler that drives the S5 switch tight and hasnt allowed the bandswitch shaft to get out of sync with Tank coil taps?
3. Did you remove the metal shield plate over the S5 switch and inspect the fixed padder caps that Dave VK5PDL suggested? Often can see signs of overheating and holes or cracks in the capacitor bodies. The three fixed padders for the Tank capacitor are C4, C5, and C40. Looking down on the switch deck they are the three brown body caps on the left. The other caps are the padders for the Plate Load capacitor.
3. Is the soldering on the tapped ceramic Tank coil good? Not common, but have seen couple of cases where taps were never soldered.
4. Have you cleaned the S5 switch contacts?
5. Do you have a Grid Dip Meter or a MFJ-259 analyzer with GDO coils?

Greetings group,
Just so there is no confusion:

It's great that members of this group are members/moderators of other groups, but this is not "the other group(s)." The rules/policies of this group were set forth prior to my "appointment" as a group co-owner, and have remained pretty much unchanged. As a matter of fact, some aspects have actually been relaxed. The requirement to properly sign your post/msgs is applied to all group members, not a select few. There is no set time for a new group member to be on moderation. In simple terms: the more you participate in group discussions/activities, WHILE AT THE SAME TIME following the group rules/policies, the shorter your moderation time. This time frame is fluid, AND up to the discretion the co-owners/moderators.
This group is not ran/administered by "you two guys." This group is administered by the following:
Walt - n9wb (co-owner) Joe - wb7uqu (co-owner) Ellen - af9j (moderator) Jon - kd5sfa (moderator)

No matter how hard you try to make everyone happy, it's just not goingto happen. This group currently has over 4000 members. Many are on the side lines, reading what's posted, etc.. on the average, there are 40 logged on at any one time...I've seen it as high as 95, but 40 is about average. Out of this number, only a very small fraction seem to have a problem abiding by the group rules/policies, which by the way, you agreed to when becoming a member, or stating that's not the way Group X does it. This is not Group X, or any other group. If for some reason, you feel you can not, or will not, abide by the group's rules/policies, please feel free to unsubscribe.
If ANY group member has comments or questions regarding this topic, address them to ME directly via: stilesjoseph@...

Thanks for your time...I now return you to your regular program..... 73

I forgot to mention in addition to checking all three couplers need to check the Plate Load capacitor to make sure no axial movement of the rotor. Grasp the shaft and push/pull and observe the plates and make sure no movement. Very close spaced plates and any slight movement will short the movable plates to the fixed plates. Never seen it on the 520 series but seen it several times on the 530/830 series. If there is movement inspect the white thread locker sealant on the rear frame pivot point adjustment screw. This is the outboard bearing point for the rotor and if the screw backs off the plates can short.

In addition to exciting the Tank with a GDO to confirm that the resonant points are good it can be helpful to have a digital LCR bridge to measure the capacitance at each bandswitch position. Have to lift the L7 safety choke and R1 10k RF sens divider resistor to make those measurements. If total capacitance isnt normal most common failure is bad fixed padders. These must be replaced with Class 1 RF caps as regular caps cant stand the dielectric heating from RF current.

Topic: 53884 Message: 53919

Okay, more testing with Terry's recommendations:

I believe you said that the plate current dip on 40 meters is occuring at 3:00. That would mean the indicator would be pointing just CW of the 28mhz position at the end of the travel arc. Is that correct?

If that's what I said, that's not happening now, the 40M dip (very shallow) is halfway between 3.5 and 7.

Did you remove PA cage cover and confirm that the plates are not meshed at the 40 meter 3:00 pm dip?

The plates are fully unmeshed at the 3:00 position

Do any of the bands have normal plate current dip at close to the white scribed indications on the front panel arc?

3.5 - dips around 7, very shallow dip, about 160 ma max
7 - dips halfway between 3.7 and 7, very shallow dip, about 160 ma max
14 - dips at 14 with a more pronounced dip, 160 ma max, about 30 watts on the Bird
21 - dips between 21-28, max about 160 ma, 50 watts RF max

1. Is the Tank capacitor coupler tightened properly and hasnt slipped letting the front panel indicator get out of sync with the actual degree of plate mesh?

Check

2. Is the red/brown fiber coupler that drives the S5 switch tight and hasnt allowed the bandswitch shaft to get out of sync with Tank coil taps?

Check

3. Did you remove the metal shield plate over the S5 switch and inspect the fixed padder caps that Dave VK5PDL suggested? Often can see signs of overheating and holes or cracks in the capacitor bodies. The three fixed padders for the Tank capacitor are C4, C5, and C40. Looking down on the switch deck they are the three brown body caps on the left. The other caps are the padders for the Plate Load capacitor.

Yes, quite a while ago. No holes, burn marks, etc. I did see a very light dusting silver in color on the body of the largest cap near its leads. It easily rubbed off with my poke/prod stick.

3. Is the soldering on the tapped ceramic Tank coil good? Not common, but have seen couple of cases where taps were never soldered.

Check

4. Have you cleaned the S5 switch contacts?

Yes, one of the first things I do. Blow 'em out with air and spray contacts.

5. Do you have a Grid Dip Meter or a MFJ-259 analyzer with GDO coils?

Not yet, just ordered an MFJ dipper, should be here by the end of the week

I forgot to mention in addition to checking all three couplers need to check the Plate Load capacitor to make sure no axial movement of the rotor. Grasp the shaft and push/pull and observe the plates and make sure no movement.

Check

In addition to exciting the Tank with a GDO to confirm that the resonant points are good it can be helpful to have a digital LCR bridge to measure the capacitance at each bandswitch position.

Just ordered an LCR bridge from Amazon - should be here this week (I'm serious about fixing this 520)

Thank you again Terry for your valuable time trying to help me get the beast running properly, I sincerely appreciate the assistance :)

53920. Hybrid Net Update (Feb 1, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-01 21:21:32 UTC
From: Mark Gilger
Topic: 53920 Message: 53920

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by me, WB0IQK. There were
22 stations checking in under good
conditions. There was 8 new station checking
in, K4JQL, WU3D, N3NUT, KD1UU, WB0VPS, W3OJ, K8TPH, and VE3JEV.

We had the following number of radios checking in.

3 running TS-520(x)
1 running TS-530(x)
3 running TS-820(x)
5 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830s + Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
22 stations checking in under good
conditions. There was 6 new station checking
in; KG7YSH, W7VTT, KE0BEE, KG7CAF, KK6UOB, and N6PDQ

We had the following number of radios checking in.

5 running TS-520(x)
2 running TS-530(x)
2 running TS-820(x)
3 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
1 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday□s net total = 66, Sunday□s total = 46
December 2015, Saturday□s net total = 55, Sunday□s total = 73
January 2016, Saturday□s net total = 129 ,
Sunday□s total = 81 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Mark, WB0IQK

53921. Some info on the IF output

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-01 22:37:30 UTC
From: aclundwall@...
Topic: 53921 Message: 53921

Can someone point me to a dumbed-down explanation about how the IF output on the TS-830 works? I understand that this output can feed a SM-220 or a more modern panadapter. I've watched all the videos, and seen it being done. And I understand how SDR works! What I don't understand is how the IF Out provides the pandapter with frequencies other than 8.83MHz!

Thanks,
Art, W5ACL

Hi Art,

The IF output is 8.83MHz so if you tune your SDR to 8.83MHz you can see/receive everything that is on your IF. Then switch your radio to whatever band you like and depending on your SDR you'll be able to see above and below the frequency your radio is tune to. From memory I believe the sidebands are inverted but it works really well.

Why do to want different frequencies?

1. When you get these shallow "160ma" dips do you have the plates of the Plate Load capacitor fully closed or meshed (Plate Load control full CCW)? Is this the initial Plate current dip in Tune mode or a second dip in CW mode?

2. After you dip the plate current to 160ma what happens when you open the plates of the Plate Load capacitor and begin transferring RF current to the dummy load? Does the plate current go up scale from 160ma?

3. Is there any signs of discoloration (darkening or blackening) of the RF plate choke between the Final tubes?

4. Do you have a spare good set of 6146 final tubes you can try? What you describe sounds like tubes nearing end of life.

Terry K9TW

53926. Re: TS-520S - can't tune on 7. 3.5,1.8

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-02 00:57:20 UTC
From: bucket@...
Topic: 53884 Message: 53926

Okay - put another set of finals in and the dip is a little more pronounced but low RF output. Here's what I observe on 7 Mhz:

- Peak ALC in tune mode
- Meter in Ip mode, change from tune to CW, dip current, load cap is fully meshed. 150 ma, RF out about 70 watts
- Open up load cap, plate current increases to ~170 ma, RF out drops to about 20 watts.

The RF plate choke color looks good. Question 1 answer is the plates of the load cap are opened just a little when I dip the plate current in CW mode.

Hope I fully answered the questions. I have one more set of finals on the shelf and I could take a known good set from another 520.

Thanks again Terry for helping!

John

Topic: 53921 Message: 53927

A panadapter is connected after the mixer and before the IF chain. On the back of the TS-830, IF1 jack is wired internally before the IF chain and that's where the panadapter input is connected. IF2 is connected on the output side of the IF chain and is connected to the vertical input of a scope, vertical input of the SM-220, or similar type scope. This, for the most part, just provides some eye candy viewing at the listening frequency whereas a panadapter connected to the IF1 jack, allows you to view a slice of signals on either side of the listening frequency. The panadapter finds it best use on less crowded or semi-dead bands. Although it can't find signals, the panadapter, if you stare at the screen long enough, will show you when a signal pops up near your frequency.

Obviously an SDR receiver, or SDR transceiver, if tuned to, in this case with the TS-830S, 8.83 MHz, the SDR equipment will display a range of frequencies on either side of where you set the tuning knob on the TS-830S. The connection has to be made to the IF1 jack on the TS-830S. And, as was indicated in another post, if the TS-830S is set to LSB, the SDR is generally set to USB and vice versa. Also, when on SSB, and you're listening to a station coming through on the TS-830S speaker clearly, you'll find you have to shift the IF setting on the SDR by roughly 200 Hz to have it come in clear on the SDR speaker if you have one connected.
Pete, wa2cwa

OK after you open the plates of the Plate Load cap (turn knob CW direction) and the plate current goes up to 170ma do you then immediately readjust the Plate Tune (tank) capacitor)? Anytime you adjust the Plate Load cap have to immediately readjust the Plate Tune cap.

Have you tried loading per the instructions in your Operating manual?

After dipping the plate current (tuning the tank to resonance) in Tune mode you are directed to place meter in RF relative power position and alternately adjust the Plate Load and Plate Tune capacitors for maximum meter indication. If the meter pegs full scale simply adjust the RF sens pot for approx 2/3 scale indication just so you can readily see the peak. No where in the manual does it tell you to load using the old dip and load method.

With external wattmeter you can leave the meter in the IP position if you like and after doing that initial plate current dip then alternately adjust the Plate Load and Plate Tune for maximum RF output power on your Bird wattmeter (shoot for a max of 100watts into 50 ohm dummy load). A normal rig will do that without exceeding around 200 to 210 ma IP. Some people like to dip again when the switch from Tune to CW mode and that is OK but not necessary.

Just keep keydown short no more than 5 to 10 seconds.

Go to You Tube and watch how Alan W2AEW loads his TS830S. I believe it is video 158? Same way to load any KW hybrid.

Ken K4EAA teaches a "hybrid" method for loading KW hybrids. He does the dip and load up to a point and then finishes by using RF relative power position. That of course works, but not what KW directs you to do in the manual.

When you say that the power drops from 70 watts with Plate load cap completely meshed to 20 watts when you just crack it open that sounds like a problem with the fixed padder caps. Does it behave like that on 80 meters as well? Fixed padders across the Plate Load cap are not needed on the higher bands.

I am trying to discern if this a problem with how you load vs an actual defect in the Pi-network.

Absent the digital LCR bridge to measure the total capacitance you could place a coaxial Tee on the SO-239 and temporarily connect external fixed capacitors or an air variable to the open ended tee and see if that fixes the problem. If it does you then know that the Plate Load cap isnt seeing those padders switched in via S5 switch.

Hello again Terry,

I've used Ken's tune up method and also followed the book, think I'm good to go on proper tune-up process. I have two other 520s and an 830 that I can tune up with no drama.

Yes, same basic reaction tuning up on 80 meters as 40 meters. I have an LCR bridge being delivered today :) in the meantime I'll see what I can cobble together to add more capacitance like you recommended. I have a T around here somewhere.

I've ordered some padders, trying to find Type 1s is really difficult - I was on Mouser quite a while yesterday and gave up, so I found some 3KV versions that might do okay.

OK. No disrespect intended, but I dont know you and have no idea about your experience level or knowledge so always need to determine if the person understands how to load a KW Hybrid. Always need to make sure that operator error or practice isnt the problem or a contributor. You would be surprised how many folks think that the Drive control is a level control!

If you cant find a way to temporarily tack on some capacitance at the SO-239 in Tx mode and want to measure the total capacitance I can help you with that. I already mentioned that you will have to lift the safety choke and the RF sens 10k divider resistor. Cant have any dc paths to ground when using your capacitance bridge. Suggest that you remove the Fan to get access to the choke and 10k resistor. It is easiest to take miniature dykes and cut one side of each components lead wire than to try to unsolder them. Can then just tack the lead wires back together.

From my notes here is the total capacitance with Plate Load cap and Plate Tank cap plates fully meshed: (I can provide the range as well if you want that)
160 = 2410pf
80 = 1580pf
40 = 1090pf

Of course it is easier to first hang some capacitance on and see if that fixes or improves it before lifting components. Kind of unusual for 160, 80 and 40 padders to all be bad or for all three S5 bandswitch contacts to be bad.

Yes temp coefficient caps use to be in every ones junk box and at hamfests. Not so much anymore. You can use COGs if you cant find NPO or N types and yes can use 3kv Class 2s if all else fails.

Before you start lifting components to use your new LCR bridge try cleaning all the wipers on the Plate Load capacitor. There are 4 of them. Not likely missing a gang/section, but possible.

There is one other test you can do with your new LCR bridge. Can measure the padders in place. This test will tell you if the padders are good, but wont tell you if the Tank Capacitor and the Plate Load capacitor are seeing them.

1. Turn rig over and remove the metal shield plate from the S5 switch compartment.
2. Place bandswitch in 29 mhz position.
3. Looking down on caps left to right the three on the left are placed in shunt across the Tank cap and the three groups on the right side are placed in shunt with the Plate Load cap.
4. Connect one lead of your bridge to ground. Use short test leads. Touch or clip other test lead to first Caps on the far left. Repeat this from left to right and record the values.

Here are my test results using a BK bridge and a AADE bridge.

Tank Capacitor Padders:
1. 415pf (2 in parallel)
2. 100pf (single cap)

Plate Load Padders:
1. 2075pf (3 in parallel)
2. 860pf (2 in parallel)
3. 267pf (single cap)

Your readings should be within about 5% of these. You are looking for gross differences. If you get these values you know that the padders are all good. However, as mentioned above you dont know if they are being seen by the Tank and Plate load caps.

Only reasons I can think of why not being seen include bad or dirty S5 bandswitch contacts or bad solder connections at the bandswitch terminals or at the chassis ground post.

If you get these values then I would pull the fan and clip the two leads as previously noted and measure total capacitance on 160, 80 and 40 bandswitch positions.

That pretty much exhaust the help I can give you.

Good morning Terry,

I did add some external capacitance on a "T" - I pulled a three gang variable cap (load cap) from a 520 I parted out and added it to the "T". Each gang measured 440pf and I tried one and then two gangs. I didn't makes notes (should have) but as I remember the dip seemed a little more pronounced but basically that was no silver bullet for my problem. I still cannot load past about 160 ma no matter what I try.

I started to isolate the tank to measure capacitance but happy hour got in the way of completing the task. Oh, I did clean the wipers with no change.

Thanks for the additional ideas - I'll get back on it today. Even if I can't get this thing fixed, I have certainly learned a bunch thanks to your help. I'll keep this thread updated.

OK John

1. What is the HV doing at 160ma?

2. What does the Plate block and coupling cap look like? Any signs of discoloration or cracking in the body?

3. Is the RF plate choke the pi-wound or weave section wound style or the solenoid wound style? Pi wound are bit more hardy than the solenoid wound ones.You reported no signs of blackening or discoloration on the RF plate choke as I recall.

4. You may want to replace the Plate Block/Coupling cap. If dont have one pull the one from the TS520. It is one from top of Plate choke to the Tank capacitor.

Topic: 53884 Message: 53935

Hey again Terry,

Some test results...

Tank capacitor padder caps measured in-situ:

403.3 pf
101.3 pf

Plate load padders:

2035 pf
833 pf
271 pf

I finally did manage to isolate the switch/caps and I think I'm right in the ballpark (load/plate caps fully meshed) - here's my capacitance readings from the top of the ceramic coil to ground:

1.8 Mhz - 5.2 nf
3.5 Mhz - 2.227 nf
7 Mhz - 18440 pf
14 Mhz - 1579.5 pf
21 Mhz - 1170.1 pf
28 Mhz - 756.1 pf
28.5 Mhz - 755.8 pf
29.1 Mhz - 755.6 pf

So unfortunately there doesn't appear to be any smoking gun here and it still is acting like bad finals. I'm going to try a known good set from one of my working 520s just to eliminate that possibility. I'll save my readings in a notebook so I can refer to them later if needed.

Thanks guys. I was actually looking for a different answer...but I did a poor job of asking my question! As it turns out, I'd misunderstood some of the videos I'd seen. I watched two videos where I thought the guys were using SDR panadapters fed by the IF1 output on their TS-830s. In some of their shots, you could see the frequencies the SDR software was displaying, and instead of a frequency of 8.83 mHz (plus or minus some number away from that frequency), they were displaying the actual frequency numbers...like 7.175 or 14.125...etc. That got me all confused...I couldn't understand how the SDR software knew the original frequency of the signal, if it was being delivered by the IF1 output centered at 8.83mHz!!

But what was really going on, I think, was that their panadaptors were connected to an antenna, NOT the IF1 output from their TS-830. In all the videos I watched later, the ones where the operator specifically stated they used the IF1 output on their 830's all displayed the frequencies I'd expected to see.

I feel like a dumbass...but I still wanted to say thanks to the guys that tried to answer my question!

Hi W5ACL,

You never know if you don't ask. I've seen the
same thing you've seen and the key is the radio
and the software. Some SDR software can read the
operating frequency of the radio and compensate
for the offset against the IF output frequency.
Now that's a really simple explanation and I know
there is a whole lot of detail regarding radio
setup, software setup etc but the point is, you
weren't seeing things and it can be done just not with the 830

Regards

Lou

I too have been hit by one or two scammers on QTH.com in the last couple of weeks. (I have run a couple adds for some Hallicrafters gear.) The scammers always pick a call listed on QRZ.com from a ham not giving his e-mail address. They seem to like setting up a G-mail account with the call letters scammed in their g-mail address. They also seem to like using PayPal as the payment method. Of course if you tell them you will send your personal check to the QRZ mailing address, they baulk! Since all their info is bogus, you will wind up PayPalling them funds, never get the equipment and they will be gone on to scamming someone else with another call with no e-mail address on QRZ.com and be offering other equipment from pictures gleamed off of Google Pictures. They will also have set up a new G-mail address for their next victim. I have been hit three times in the last month. I suspect they use a new call, new e-mail address, and new PayPal account for each victim. Just be very leery and your senses will tell you, you are being set up. In many cases you will note their English is sub standard but not always the case.

I have also been targetted by these scammers. Here in Oz, we have an ACMA website that you can use to find out if the callsign matches the name. You can then look them up in the phone book and give them a call.

In any case if you talk to the guy, his bad English will usually give him away.

Another good idea is to get the guy to send you a photo of him next to the equipment - if they refuse, give it a miss.

Hope this helps someone.

Cheers,

Peter - VK2AN

Hi all. My dad talked me into getting a Kenwood 520SE when I got my General ticket. Unfortunately he passed before he could teach me how to use the rig. I have the tune up instructions from K4EAA and they are pretty easy to follow. I set my rig up to participate in JOTA and all went well, until I got the rig back home. I can get the DRIVE control peaked as usual. The problem is when I try to dip the PLATE control. I set the METER to lp, flip the SEND switch and try to dip the PLATE control. The needle pegs all the way to the left and there is no dip. I have tried to turn up the LOAD control to bring the needle up so I can see a dip, but that doesn't work. As far as I know, everything is original to the rig. I am pretty sure operator error is the problem but I just don't know anything about tubes/finals/my rig so I don't even have a clue about where to start with troubleshooting. I hope I have provided enough information about the problem, am I doing something wrong or is there a problem with my 520SE?

Thanks for your time!

Carol,

I forgot to ask if you have the TS-520SE operator/user manual. If you do not have it then you can download it from my website free using the following link:

http://w5rkl.com/wp-content/uploads/2014/04/TS-520SE-Instruction-Manual.pdf

I recommend you download the manual then spend some reading the manual before you attempt to operate your TS-520SE. A lot of "operator errors" can be prevented by spending time studying the operator/user manual.

Do you have a 50 ohm dummy load? If you do not then may I recommend the MFJ 264 1.5KW dry dummy load. There are other dummy loads but with your limited experience I recommend a higher power rated dummy load.

From: KC2KXV@...
Topic: 53839 Message: 53952

Jose and group,

I have 2 820S's and 1 820, they all exhibit a small amount of "white noise" with no antenna, but when the antenna is connected it comes up in some cases to S2 -S3. The 820's all have great sensitivity but all in all find them much nosier than the 530 and the 830. In the operating manual there is an adjustment for the voltage to the AGC, which I've adjusted to spec -- I suspect this biases the AGC amp.

I apologize if this has been dealt with in earlier posts -- but I would be interested in the latest thoughts, and if there are any suggested "mods" or adjustments to reduce the white noise over the signal -- I suspect this was a known issues and was designed out in the 530/830.

I prefer the 820 for its sensitivity and the RF compression on the audio -- so am interested in "fixing" the problem if there is a solution.

Best and 73's
Vinnie

Hello Carol, I believe the 520 would be about the same as the 820 and the only thing I didn't see you say was adding some carrier to bring your drive up so you can dip the plate. Mine will be all the way to the left until I add some carrier and then the meter will rise some then you can dip the plate to the left. But again mine is a 820 and I have never tunes a 520 before.
I hope this helps and If I'm wrong I hope someone corrects me soon.
Good luck and 73's

Unless you are active in looking to buy/sell something radio related, you probably wouldn't know about the scams. There are two sections in the QRZ forums where you can get alerts. First one is the Stolen Radios, Scams and Rip-offs area, then under Ham Radio Gear for Sale, look at the Active Scammer Alert. Then in QTH classifieds some will report scams.

Since I've been buying some stuff I've been closely following those above threads/sections. As a rule of thumb, if the scammer has a call sign and a name with a gmail address, it's probably a scammer, i.e., georgek1abc@gmail.com. Once everybody catches on the the scam, they will probably adapt and try something else.

As a preventative measure, I just signed up for a gmail account with my call sign so a scammer can't 'steal' my callsign to use with gmail. If I was really anal about this, I should probably do the same thing with Yahoo/Hotmail, etc. but this will do for now.

Carol.
  Congrats on your General Ticket, and sorry about the loss of your dad.
Mike-w5rkl gives good info. Obtain the owners/operators manual and READ it numerous time with the rig in front of you. As you may have noticed, these rigs are heavy and it's easy to move a switch/control without noticing it...especially the "SG" switch on the back panel. Sometime ago, a member put forth a problem about not being able to tune up, after he moved the rig and cleaned/dusted behind it...the "SG" switch had been accidentally moved to the OFF position. There are lots of difficulties that can be solved by checking the position of ALL the controls/switches against the basic settings stated in the manual.

The call sign was typo on my part. the correct call sign was indeed ka2ssx, but was using an email address not associated with the real owner of the call. The real owner of the call, posted last night on QRZ, under the scams & rip offs forum, that indeed the ad on QRZ and our and other Yahoo Groups are false. This group has been lucky and has been relatively free of such stuff, and the group's administration, especially myself, depend on group members to alert us of stuff like this. If such info is given, it will be authenticated to the best of our ability, and if it is determined to be factual, the offender is banned from the group, and any post(s) by said offender are removed from the group archives. A group member sent me a suggestion about limiting "for sale" items to Kenwood hybrid rig(s)/items. This will be taken in consideration. The is also a way to send out a "poll question" to all group members, I just need to research on how to do it correctly...as I really don't want 3,000+ emails to wade through...hihi 73

HOORAY!! it works!! it was the SG switch, it had gotten turned off. THANK YOU!!

I do have the owners manual, i had lost it for a month or so and downloaded a copy off the internet. I have it and my tuner's manual and a band plan flyer in a binder sitting on the rig. i have read the manual but i dont understand some of it. The diagrams in the back are Greek to me.

Again, thanks so much for the help, i am going to be using this rig for the NC QSO party at the end of this month, I hope to hear you on the air!

I'm glad your TS-520SE is working. My first Kenwood hybrid was a TS-520SE with a DG-5 digital display. I used it a lot on 20 meter RTTY and 10 meter DX in the early 80s. I sold it back in the early 90s, big mistake but that's water under the bridge.

Have fun in the NC QSO party, I'm sure you'll work quite a few stations.

Ron,

1) Meter switch to Ip

2) Mode switch to TUNE

3) Marrow/Wide switch to WIDE

4) Send/Receive switch to SEND

That should work for you. BTW, do you have the operators manual for the rig? If not, you can get one of off the internet.

Last few things I can think of and a couple you suggested Terry.

- On a whim I measured the 6146 heater voltage and we're okay there - 13VAC at the first 6146 (6VAC across its filament), 7VAC across the second tube's filament.

- Measured HV in receive at the plates, I get >900V, transmit is >800V.

- On another whim, I replaced the T/R relay with a new one - no joy.

- Tried the finals in a working 520 and they are good so it's not the tubes.

- Caps and inductor replaced long time ago in the final cage (hybridrestore.com final cage repair kit.)

I hate like heck to give up on this one since I have so much time and $50 worth of parts in it so far. I'm not against wholesale replacement of the entire final cage with some pull parts if you think that might be one last thing to try. Sigh.

Carol,
Glad to hear that it was a simple "fix." As I stated prior, many problems can be fixed/solved by reading the owners/operators manual, and making sure that all the controls...etc. are in the "basic" positions according to the appropriate manual, especially after being moved...transported.

Hope you had a great time during JOTA...scouting seems to a dying "art."Me, I never made it to Eagle Scout...as girls became more important...hihi,but I still carry the "scouting motto" with me every day.
I hope you enjoy you time with us..... 73

I agree Mike,A lot of heartache can be prevented, by a person reading this manual. I am a living example. I purchased a 530S from an estate sale, and had it not been for the manual, a lot of problems would have come up. With it, things are much easier.

Carol,

I forgot to ask if you have the TS-520SE operator/user manual. If you do not have it then you can download it from my website free using the following link:

http://w5rkl.com/wp-content/uploads/2014/04/TS-520SE-Instruction-Manual.pdf

I recommend you download the manual then spend some reading the manual before you attempt to operate your TS-520SE. A lot of "operator errors" can be prevented by spending time studying the operator/user manual.

Do you have a 50 ohm dummy load? If you do not then may I recommend the MFJ 264 1.5KW dry dummy load. There are other dummy loads but with your limited experience I recommend a higher power rated dummy load.

All

After a very long drought the Las Vegas Amateur Radio Club is sponsoring a convention to be held on April 29, through May 1st this year.

We are looking for speakers, vendors and participants. As an owner of a 520 and a 520S I am hoping to see if someone from our group

would be a speaker. We are also planning to host impromptu “birds-of-a-feather” sessions in the room set aside for meals. I hope we will have a Kenwood

hybrid session. Please check out http://nvcon.org/ for more information.

Hope to see you there.

Gary Desler

I realized that my will isn't strong enough to withstand the lures of a tube linear... a Drake L7 will soon find a new home at my shack. There is one thing I don't understand: the PA is a linear amplifier. If it has a 10db power amplification, every watt input will yield ten watt output. The question is: how do I reduce the power output of the PA, maximum PEP output in Germany is 750W on most bands?

I understand that it's not good practice to reduce mic gain to get less than 100W from the TS830. Instead I learned that one uses a pot with a negative voltage at the ALC pin of socket at the rear. Unfortunately, the L7 has a ALC line that must connected to this ALC pin... how am I supposed to run the PA with less than full power (and 100W input from the TS)? Modern transceivers can easily reduce output from full power down to 1W, but the TS830?

Martin,
You probably will want to simply control your output via the ALC control method referenced in Kenwood Tech Bulletin #2. It's the last page of the referenced attachment.

http://wb4hfn.com/KENWOOD/Articles/Pwr_Ctrl_Cir.pdf

Have fun, the L4B is a great Amp. I have 2 of them.

Martin,

Some folks will say that you don't need the ALC, but I always connect it when using my hybrid rigs with my ALS-600 solid state amp. Initially, I was worried also about the "ALC overshoot" issue on my Kenwood TS-590s (since corrected). My solution was to build and use a 2dB pad designed by Phil Salas (AD5X) in the output of the rigs to reduce the 100W output to about 65 watts. The article is on Phil's website if you google his call and the attenuator is presented as a complete project with part list and all. As described, it uses a relay to switch on when 12 VDC is supplied by the ALS-600 being turned on and it works like a dream.

It uses thick-film resistors as the main element and you could tailor it to provide the attenuation/drive input you want into the L7 for 750W output and use the ALC as well. Another option for you to consider. Phil's stuff is great.

Topic: 53970 Message: 53973

Martin,

There is nothing in the Drake L7 manual that states you MUST connect the amplifier's AGC connection to the TS-830S Remote ALC input.

You can connect the "qrp circuit" to the TS-830s remote ALC input pins to lower the TS-830S RF output to the L7 amplifier.

The L7 AGC (commonly referred to as "ALC") can be defeated by turning the AGC control, inside the amplifier, fully CCW as stated in the L7 manual, page 3-1 paragraph 3.2.

The 2 QRP circuit files, both pdf files, that you are referring to can be downloaded from my website using one of the following 2 lines:

http://w5rkl.com/wp-content/uploads/2015/02/Kenwood-Hybrid-QRP-circuit1.pdf
http://w5rkl.com/wp-content/uploads/2015/02/Kenwood-Hybrid-QRP-circuit1.pdf

http://w5rkl.com/wp-content/uploads/2015/02/TS-520S-QRP.pdf
http://w5rkl.com/wp-content/uploads/2015/02/TS-520S-QRP.pdf

If you do not have the Ts-830S user manual, you can download the manual also from my website using the following link:

http://w5rkl.com/wp-content/uploads/2014/04/TS-830-operators-manual.pdf
http://w5rkl.com/wp-content/uploads/2014/04/TS-830-operators-manual.pdf

Connect the coax between the TS-830S and the L7 RF input.

Connect the QRP circuit's "Negative" output to the TS-830S REMOTE DIN socket pin 6 and the QRP circuit's ground to the rear panel. Tune the TS-830S into a 50 ohm dummy load then adjust the qrp circuit for the desired RF output to limit the L7's maximum power level authorized in Germany.

I operated as DA1TNJ from February 1999 until June 2004, lived in Leonberg, Germany. I worked for General Dynamics as a computer and network support contractor at HQ European Command in Vaihingen.

It's recommended the AGC for the L7 or L4B not be used. Just use the AGC in the radio to control your output to get your 750 watts output that your limited to. Any of those AGC circuits that Mike or I sent you will do just what you need.

Just control the amplifier input by controlling the output of the transmitter. That's a much better way of doing that and it makes us all become better operators.

to reduce output to what your amp can handle just turn down the carrier level pot on CW but for SSB you have to make a battery/pot control box to connect to the rig's ALC input. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Greetings group,
   If I did it correctly, you should be receiving a "poll question," regarding items as being for sale. Just a heads up..there are 3 choices: yes, no, and don't care. The poll will be open for 30 days, and the results are(thankfully) automatically tabulated. Depending on the results, group rules/policy may be changed...or a further refinement of the poll question may follow .

Topic: 53970 Message: 53982

Do I understand this correctly:

The linear is connected to the TS830 via standard 50Ohm coax cable and the closed-when-active relay contact at the remote connector. I tune the TS830 to full power as usual into a dummy load. Then I turn back the output power via the TS830 ALC circuit (pot & 9V battery).

Next step is tuning the linear as described in the PA manual.

At last I adjust the ALC circuit at the 830 to the expected output power. The linear is always running full throttle, the exiter regulates the output power.

Right?

Thanks for your help,

Martin DB2MJ

Hi guys, I am new here, Mario from Croatia, 9A3DLZ.

I recently bought a TS-520 and I am very happy with it, but I noticed few things that needs fixing. Maybe you will have some advice on how to do it. First, Drive knob is very hard to turn. I first thought it was jammed. I opened the cover and there is nothing in the mechanism that would stop it from turning. Drive shaft turns three variable capacitors and I thought if I maybe need to lubricate it.
It appears that the meter is showing wrong current IP and wrong HV when in tune mode. Current reads almost zero and the dip in the current is very hard to notice. HV shows over 1000V (also in tune mode. But when working on CW, IP is around 200mA and HV is around 800-850V.
I must say that the radio is working perfectly, I run it today first time at full power and got over 100W forward.

I think this is all.

Mario, 9A3DLZ

The 599A's and 599D's were identical except for cosmetic differences. However, there were a number of circuit changes made to the original 599's besides the moving those two controls to the front panel. I would look for either the 599A's or the 599D's. I've had my 599D's since the last 70's and they still work great. If you find any of the "Twins" make sure the interconnecting cable is included. Without them you can only use them as separates and there will be no transceiver function.

Yippee! On with the post mortem

I think I was fighting two separate problems, first problem was the original tuning issue on the low bands. That was apparently fixed with more spraying/operation of the S5 switch contacts. It did dawn on me quite a while ago that I could indeed tune up on the low bands and figured the spraying finally worked.

Then the one that dogged me for hours and hours was the low output situation. I got back at it a while ago and thought I would measure voltages on the finals and check them according to the schematic. Drive voltages were okay, then I checked screen voltages. Screen voltage on V1 was ~260 volts, moved the probe to V2 and screen voltage was 0. What? I must be off a pin. Checked and double checked and sure enough zero volts on V2 screen. Sitting between V2 screen and the voltage source is R6, a 100 ohm resistor. But...

I replaced the screen resistors with a new ones when I was recapping. Checked the resistor in place and it was measuring infinity. Wow and wow, a brand new Chinese 100 ohm resistor was really an insulator.

Replaced that resistor with another one (checked first of course) and we're rocking folks! Putting out over 100 watts from 160 meters to 10 meters . So now I wonder how many of my Chinese resistors are bad - I will check every one I use from now on.

A huge thank you goes out to Terry and everybody that helped me, your assistance was absolutely invaluable. A special thank you goes out to Terry, I learned so much from you in the troubleshooting process. I think what I lack in brains I make up for in determination to some degree.

John, happy camper

Kevin and Pete,

I have a recently-acquired pair of 599D's. I have read that the differences between the 599 and 599A's were the location of the controls already mentioned, as well as rubber drive belts instead of the chain drives in the later models. There, I believe, were mods to convert the rubber belts to chain drives, as the belts could be hard to replace when worn. I think I'm remembering this right, so you might want to look out for that. Second on the interconnect cable-you have to have that!

Subject: [TS-520_820_530_830] Re: Twins

The 599A's and 599D's were identical except for cosmetic differences. However, there were a number of circuit changes made to the original 599's besides the moving those two controls to the front panel. I would look for either the 599A's or the 599D's. I've had my 599D's since the last 70's and they still work great. If you find any of the "Twins" make sure the interconnecting cable is included. Without them you can only use them as separates and there will be no transceiver function.

You are correct in that the Drive knob should turn freely.
Personally I don't think lubrication would hurt, however someone else will have to advise you on that.

As far as the wrong current goes, I had a similar problem.
Check on the back of the radio for the SG switch and make sure it's set to ON. That solved my problem.

If you don't currently have a copy of the owner's manual, please download it
and read it. It helps a bunch.

I hope you make lots and lots of contacts! These are great radios!

You need to spray contact cleaner on the shaft wipers in the drive capacitor bank and there might be some old stiff grease on the shaft near the front panel. Spray and rotate the knob back and forth until it loosens up.

Are you following the tune up procedure in the manual? You should be reading about 800 volts on the meter in transmit and 200 ma in CW mode after tuning.

Hi,

I have an AT230 antenna tuner, and a while back, the plastic shaft that connects the X-TUNE knob to the variable capacitor broke. To remove and replace this shaft, basically the whole unit has to come apart. But it's not that tough, and tonight I turned down a replacement shaft out of brass on my lathe.

The problem is, these variable capacitors have no stops...they can turn through 360 degrees and keep going! but without a hard stop, and since I can't remember what position the R-tune knob was in when I disassembled the tuner, I don't know how to clock the knobs when I reassemble!

The knobs are labeled with numbers from 0-10, with 0 at 9 o'clock on the faceplate, and 10 at 3 o'clock. If I knew which number (0 or 10) corresponded to the rotor and stator being completely meshed, I'd be able to figure out how to orient the knobs! So, if anyone knows which is which, I'd sure appreciate it.

Thanks,
Art W5ACL

Topic: 53884 Message: 54004

John:

If running on just one of the two parallel 6146B finals you just cut the Plate Load Impedance in half. Approx Z of pair of 6146Bs is 2400 ohms. The Pi Network Plate Tank capacitor and the Plate Load capacitor values are selected for an approx loaded Q of 12 based on that 2400 ohm tube load.

Now with the tube load reduced to approx 1200 ohms the value of capacitance that you need in the Plate Tank capacitor and Plate load capacitor has doubled.

So for example on 40 meters with both tubes (2400 ohms) being seen by the Pi-network you would need approx 115pf in the Tank cap and approx 700pf in the Load cap. Those values are well withing the range of the two caps. Tank cap full meshed is approx 200pf and Load cap full meshed is approx 1200pf.

With 1200 ohms being seen by the Pi Network now need 2X those values. For 40 meters operation the Tank cap would need to be approx 230pf and Plate Load cap would need to be approx 1400pf. Well outside the range of both caps.

So I think your biggest contributor to inability to obtain full load on the three lower bands was the one tube operation and not that the Pi Network wasnt seeing the fixed padder caps due to bad S5 contacts. The lower you would go in frequency the worse the situation would be as required capacitance values on 80 and 160 would exceed what was available even with the combination of the air variable capacitors with the fixed padders being switched in.

Glad you found it. As you note an unusual failure to have an open SG stopper resistor. The original 100 ohm carbon composition units most commonly drift slightly high. These "stoppers" are a carry over from the old Class C days of the 40s and 50s amplifier designs you see in the ARRL handbooks of the times. Not sure they are really needed. Probably better to wind coil over the resistor body to dampen any parallel resonances and then would keep a dc path to the tube screen grids thru the winding if the resistor went open. We have such suppressors in the control grids. Not sure why not in the screen grids. Need someone who still builds and runs grid driven tetrode amps to enlighten us.

You also talked about loading to approx 160ma as I recall. If true that was pushing one tube pretty hard. Most likely short key down times at that current level saved the one tube that was working.

Thanks for the closure.

Terry K9TW

Mario,

The main portion of the final amplifier IP meter circuit that causes problems are the cathode resistors. If they change in values, typically increase in resistance, the total cathode resistance changes which effects what the IP meter displays.

Here's how the TS-520 and TS-820 IP meter circuit works. You need to understand how the IP meter circuit works in order to troubleshoot the IP meter problems.

First, there are two 10 ohm 1 watt cathode resistors, R2 and R3, that are wired in parallel in the final amplifier's cathode circuit. This results in a total final amplifier cathode resistance of approximately 5 ohms.

10 x 10 / 10 + 10 = 5

You will not see an exact 5 ohms because each resistor is not exactly 10 ohms. However, for my explanation, I use 10 ohms for each cathode resistor and using Ohms Law formula, the answers will be 5 ohms. The meter multiplier will not be exactly 3.3K but something close to it but, again, for my explanation, I use 3.3K. The meter is approximately 600 ohms, not all meters will be the same but, again, for my explanation I use 600 ohms.

We will assume the final amplifier's cathode current is 60ma which, with 5 ohms of cathode resistance, results in a final amplifier cathode voltage of +300mv

.06 x 5 = +.3VDC

*Now we move over to the IP meter circuit. Resistor R4, 3.3K, is the meter multiplier. R4 is in "series" with the meter (meter switch set to IP). The typical meter internal resistance is approximately 600 ohms. Therefore, the IP meter circuit's total resistance (series circuit) is 3900 ohms

3300 + 600 = 3900 ohms

The final amplifier's "300mv" of cathode voltage is applied to the meter's series circuit resulting in a current level of approximately 77ua flowing in the IP meter series circuit:

.3 / 3900 = .0000769

I rounded off the answer to "77ua".

Next there will be a voltage drop across R4, the meter multiplier, that will occur which will be approximately +254mv

.000077 x 3300 = +.254VDC

We now subtract the 254mv voltage drop across R4 from the final amplifier cathode voltage of 300mv and we get approximately 46mv applied to the meter, pushing the meter pointer up to the 60ma tick mark on the top scale.

You can set the meter switch to a position other than IP and with 100 watts indicated on your watt meter, measure the final amplifier's cathode voltage. If the cathode voltage is approximately +1.1VDC with 100 watts indicated on your watt meter and the final amplifier cathode resistance is approximately 5 ohms, the cathode current will be approximately 220ma.

1.1 / 5 .220 amps

You should troubleshoot the final amplifier cathode and IP meter circuits to determine what components have failed.

Hi Mario,

If you only see problems with IP measurement in
tune mode then I would start by looking at the
56K resistors (R5 & R6) on the HV board. These
are only in circuit in tune mode. They normally
go quite high in resistance affecting the IP
reading. The fact that you have acceptable IP and
HV readings in normal operation makes me pretty
confident there is nothing else wrong.

Regards

Lou

Your ability to understand the detailed theory of operation leaves me very envious Terry. I've had quote a bit of formal electronics training (and I'm an Extra Class) but I have forgotten much of what I learned so many years ago. I'm now immersed in YouTube videos trying to regain some of what I've forgotten.

It was such a thrill to find my problem I'm even more inspired to keep at playing with these hybrids. I'm going to finish recapping this 520s, do another full alignment, use it for a while and then I suppose I'll sell it (like selling a kid I think.)

New project is a 520s with zero ALC on tune. Not the driver tube, I aligned the oscillator coils, meter works so I'm having fun tracking that down.

Thanks again Terry :)

54010. Hybrid Update (Feb 7, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-08 03:42:20 UTC
From: Mark Gilger
Topic: 54010 Message: 54010

Dayton Hamvention Forum:
There will be another Hybrid forum this year on
Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by me, WB0IQK. There were
26 stations checking in under good
conditions. There was 7 new station checking
in, KE8CEL, K3MYK, WA0YSL, W8CHM, KD8EKN, WB3CRW, and KC3RN.

We had the following number of radios checking in.

4 running TS-520(x)
1 running TS-530(x)
3 running TS-820(x)
7 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830s + Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
20 stations checking in under good
conditions. There was 4 new station checking in
KM4EQJ, WB9FOP, K5IIK, and W1YEI.

We had the following number of radios checking in.

4 running TS-520(x)
2 running TS-530(x)
2 running TS-820(x)
3 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins

1 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday□s net total = 66, Sunday□s total = 46
December 2015, Saturday□s net total = 55, Sunday□s total = 73
January 2016, Saturday□s net total = 129, Sunday□s total = 81
February 2016, Saturday□s net total = 26, Sunday□s total = 22 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

73's,
Mark, WB0IQK

John:

Been at it 55 plus years and still study almost daily.

Besides the classic texts that we grew up on today the internet is a wealth of knowledge at our finger tips.

We have discussed and listed the classic texts on Basic Electronics. RF communications, Antennas, and Ham Radio on this forum many times. Should be able to search conversations and come up with a list of books to purchase for your electronics library.

54019. 830s No audio or digital frequency

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-09 11:58:00 UTC
From: cfwirth@...
Topic: 54019 Message: 54019

I had an issue with a newly acquired 830s. When I turned on the radio there was no audio and the digital frequency did not display. I have a VFO-240 and when I turned the function knob of the remote vfo from Main to RMT-R the audio and frequency display came back on. I then turned the function back to Main on the remote vfo and they both went off. I disconnected the vfo cable from the back of the radio and reseat it. What could have caused this? Bad remote vfo cable connection?

Thanks,

Charlie W3DDF

54020. Which Kenwood is the most trouble free?

I hope this isn't a silly question but I'm just curious. I've owned a 520, 820, 820S and now a 520SE. I didn't own any of them long enough to get a feel for reliability or service. I think this 520SE I now have is the nicest of the bunch. But I'm curious as to which of the Kenwood hybrids is considered to be the most reliable?

Thanks

Kenwood Hybrids have been through the mill over the years. Take a step up to a Kenwood 940SAT. Spend the money to get a later serial number unit. You will be quite happy. I have owned Kenwood products used and new for 20+ years and not a one has failed except for product updates/recalls which the repair was done for no charge. Take a walk on the wild side, got transistors. Brad KB2CHY

I can only respond regarding my TS-520. I got it from a friend who had
it since the 70s and so far no issues at all. My second 520 I got
recently and it only had two cut wires and now works fine. I recapped
the HV caps and did some minor protection circuit changes. Otherwise
they seem to be very rock solid and reliable.

Charlie,

If you pull the VFO-240 DIN plug from the 830's REMOTE VFO DIN socket do
you have the same symptoms, loss of both TX and RX plus the digital
display is dark?

Charlie,
If the TS-830 works when the VFO-240 is removed from the TS-830 rear REMOTE VFO DIN socket then the problem appears to be a broken wire at one end of the cable. Check both ends of the REMOTE VFO cable's DIN plugs for a broken wire.

The TS-830's REMOTE VFO DIN socket pin labels are found in the TS-830 operator's manual, page 13.

Topic: 54019 Message: 54029

That's right.The TS-830, like the TS-530, has a "DIN" socket with an "embedded" SPDT switch that performs the same function as the jumper wire/jumper plug in the TS-520 and TS-820 does.

The embedded switch can be seen by viewing the TS-530 and TS-830 schematics. When the REMOTE VFO DIN plug is inserted into the REMOTE VFO DIN socket on the rear of the 530 or 830, the DIN plug mechanically moves the embedded switch so the REMOTE VFO FUNCTION switch performs the routing of the 9VDC to power the internal, external, or both VFOs. When the DIN plug is removed the mechanical action of removing the DIN plug causes the switch to provide a path of the 9VDC power to be applied to the internal VFO so the internal VFO works.

Look at the 530 and 830 schematics, you can easily see this.

I checked the vfo cable and it seems to be fine. Tonight I turned on the radio with the vfo plugged in and it worked. I left the radio on for about 2 hours then turned it off. Left it off for about an hour and turned it back on and the RX and display did not come on. So I removed the vfo cable from the back of the radio and tried again and it works fine. I am wondering if the vfo jack on the radio could be dirty. Do you think a little bit of DeOxIt should be used on the jack/plug to see if it would clean the jack?

Charlie,

A good shot of cleaner/lube, followed by inserting and then removing the "din" connector several times...then blow out with canned air....check for proper operation. Also, a malfunction of RL-1 on the IF board may be part/cause of the problem. Quite fixable, as a reengineered RL-1 can be obtained from Ken Kemski k4eaa"dot" com.

54032. Symptom - no ALC indication in tune/send

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-10 16:55:56 UTC
From: bucket@...
Topic: 54032 Message: 54032

My latest project is a TS-520s with no ALC indication on any band; after a few hours of thrashing around, reading Terry's notes on ALC and troubleshooting, I'm pretty sure the root issue is no RF drive.

Here's my troubleshooting notes, maybe somebody can point out something I've missed (almost all measurements were taken with the SG switch off):

- 12BY7 driver - okay
- R70, R71 in RF unit - okay
- R5, R6 in HV unit - measured about 68k, replaced with correct 56k
- R5 in rectifier - okay
- replaced Q2 (3SK35Y) MOSFET in IF board (think the original one was good)
- replaced Q3 (3SK41L) MOSFET in RF board (no change)
- thumped on VC1, 2, 3 variable caps on the RF board while turning Drive control

Measurements:

12BY7 voltages:
- heater 13V
- cathode 0V xmit, -3V rcv
- grid -39V
- screen 251V
- plate 344V

6146 (S2001A):

- DC bias -59VDC
- RF component of bias is 5.6V pp (measured with o'scope) frequency of 14.1771Mhz or VFO
- on transmit (SG switch on) we get about 70 ma and just barely an indication of RF on the 520's meter

TIF output on IF board 18mV RMS @ 8.7 Mhz
TIF in to RF board is 20mV @8.7 Mhz (we gained 2 mV!)
VFO in to IF board is 980 mV RMS @ 5.19 Mhz

Q10 on RF board:
Receive - emitter -93V...collector +2.75V...base -93V
Transmit - emitter -58.7V... collector +2.75V... base -59V

Thanks all,

John

Charlie,
I made an error...RL-1 is on the AF BOARD, not the IF BOARD.
The AF BOARD is on the underside of the rig, and RL-1 is the square relay on the right rear corner.
TNX to Ken-n2flp for catching my error..just can't seem to type today

That might work Charlie. Use just enough to clean the socket. Don't soak the socket.

When I use DeoXit D5 I follow up with generous amounts of canned air (Walmart sells it in their TV/DVD/Cell Phone department) to remove any cleaner residue. I then wait 3 to 5 minutes before powering up the device.

Make sure you follow the warning on the side of the cleaner can.

There is a guy that sells cans of it on eBay, just search "kenwood paint" I was happy with his color for a ts-520, although I cannot say it was an exact match to the matching speaker color and I know some purists have said the paint on eBay is off. But In my very limited experience the original cabinet colors of the Kenwood pieces I have like the speaker, tuner and mic all are little different. Probably from different age and how much they were exposed to sunlight and faded over the years. I have heard of some taking an original cabinet to a collision shop and having them computer match it too.
I am sure others have more ideas for you too.

Hi Greg,

I found a Rustoleum paint called Satin Granite. It can be found in Home Depot and Wal-Mart for under $4.00 a can. It's good quality and it will do a great job if you prepare the surface correctly. If you are really looking for an exact match to the original Kenwood paint, this is NOT what you want. It is similar, but certainly not an exact match.
This never bothered me as I carefully paint all covers, they all match each other and they look great. I'm not concerned about an exact match to the original paint. This color looks as good as the original, just a different tint. The advantage; it's good stuff at a great price and there is a local, unlimited supply.
If you do decide to use this stuff, remember that the radio covers need to be well prepared. Even the slightest scratch or spot of rust will screw up the job. Spray light, multiple coats from a distance to avoid runs.

Good Luck,
Kevin - N2FLP

Charlie,

It sounds like a sticky micro switch in din plug or RL1 on af board, or dry joint on back of din plug. This is relatively minor issue. Very common for micro switch to fail/ become full of crud

I have one more question not covered by the manual, or at least, if it's covered in the manual I can't find it.

Is it possible to use this transceiver for any of the digital modes?

I know it's too old to have a usb port, and if it has a serial port I can't find it, but I was wondering if there was some way to maybe use the phone patch ports, or the speaker/mic ports? I am curious to see if there is a way to connect the rig to my computer so I can use N1MM+ software to keep track of my frequency when contesting.

Thanks for your time and patience

It's no problem using the hybrid TRX with digital modes. Just take a cheap USB sound dongle and connect it with a homemade interface cable to the phone output and the mic input at the front. 4 pin mic plugs are easily obtainable at ebay. Send/receive switching via VOX. I check the output level of the sound dongle via SM220 and reduce output power with the alc trick (pot & 9V battery) to about 25-30W output.

One does not need to use the 9volt battery and pot (qrp ckt) when operating PSK31, RTTY or other sound card modes.
Simply tune the transmitter for normal side band operation, including setting the MIC gain control for normal voice ALC meter indication.

Connect the sound card output to the transmitter, set the meter switch to ALC, and key the transmitter. Adjust the sound card TX audio level so the transmitter's ALC meter does not rise above zero and the sound card TX audio level applied to the transmitter produces between 20 and 30 watts output.

This setup method, when switching between sound card modes and normal side band voice operation, does not require any changes/adjustments to be made to the MIC gain, just switch modes and start talking.

Shooting the socket pins will only clean the pins and not introduce any meaningful amount of cleaner into the contact area of the din switch.

You will just be hitting the switch actuator tab by spraying into the socket.

The din switch is almost a sealed unit like all the mini push button switches on the 530/830 series.

Better approach is to work from the back of the socket and you will see the switch body. It is a rectangular metal enclosure that is bent and folded and at one corner you can see a very small gap . Press and hold the nozzle of the D5 can on that corner covering the gap. Hold it tight and just give it a quick burst and then insert the din plug in and out a few times to wipe the contacts. Can then hold nozzle of canned air to same small opening.

You will get some over spray and you can evaporate that with canned air. I have thought about trying a small gauge hypodermic needle to insert in this small gap and then apply the D5 nozzle to the needle.

I don't know about a plastic flowerpot, but a variable resistor (POTentiometer) across a battery connected to the ALC pin on the back of the radio will set the power limit point a lot better than the mic gain where the limit is `still 100 W for stray voice peaks without the additional neg bias voltage applied. Right. I was educated by the much better informed members of this list
that it is bad practice to use the mic gain for output reduction on SSB.
I was told that reducing power with the ALC pin at the rear connector is
a much better way... I did that, works perfectly.

I always used the "carrier" level pot to reduce power in the CW mode. That works fine for me. Didn't ever try the ALC voltage external gadget because I rarely do SSB. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Martin and others,
You can use the qrp circuit if you want but it's not required when operating sound card digital modes. Simply adjust the sound card software TX audio output level to the transmitter to control the power output and to ensure zero ALC indication on the transmitter's ALC meter.

I use to operate PSK31 using a Yaesu FT-757GX and an MFJ sound card interface. I set the MIC gain for normal side band voice transmission but when I operated PSK-31 or RTTY, I did NOT touch/readjust the MIC gain but rather adjusted the sound card software TX audio output level to keep the power output between 20 and 30 watts with zero ALC indication during sound card digital mode transmissions.

Right all!

Long story short, no matter how you control the power output, the key is to NEVER hit the alc at any time in the digital modes.

For Charlie (W3DDF).I had same problem with my 830.... Found the rear molex connector on the counter unit board(X54-1540-00) was the culprit.It wasn't the molex but the circuit run UNDER the connector on the board itself.. I had to lift the plastic off the board and re solder the run from one of the pins.. Not sure which pin it was at this point in time but it was good repair..If you pull of the radio top cover and just wiggle the rear plug (12 pin) and see if your display and audio pops back on...Wiggle it back and forth and side to see if you can get the display on.. Not too hard, don't want to do any damage just in case fault is elsewhere.. Simple to do and might do the trick..Like I said, if that brings the radio back to life you will have to do the repair..I did "fix" my board which is now a spare. I was able to buy another unit board from one of the group members...Good luck Charlie!

It seems that I have no ALC when tuning my 830. When I first received the radio last week I was able to get a good reading when tuning the ALC but now it does not move the meter. I did replace the two HV capacitors. I used K4EAA's capacitor kit. I used to have a HV of 800 and after I replaced them I now get a little over 950. I tested the 12BY7 and it tests good. Not sure why I cannot get any ALC when tuning. Any suggestions?

Just because the tube tested ok, doesn't mean the tube isn't going soft. The if voltage is normal if. Supply voltage is from 240v input.
You have not mentioned if this is over all bands. If on 28mhz and if Alc is present then goes to zero good chance tube is going soft.
There is no mention of performance when in tune mode. if no indication in tune mode, check R15 & 16 on rectifier board. Remember if must be discharged before working on radio

I just replaced original tube, shows good on tester, but fails in radio.
Check small RF choke between tubes in PA, located at the bottom of the large white former. Typically will be darken, charred or cracked. Start with the basics then move forward.

I do not trust tube testers to tell me whether a tube is going to operate properly in the circuit it's used in, or not. I use a tube tester to test for the following:

1. Shorts between elements (after 15 minute warm up)
2. Open filaments (Yes I can use an ohm meter to test for open filaments)
3. Simple emission conduction.

It's been my experience that tube tester results cannot always be accurate.Case in point with a 6GW8 (Triode and Pentode in one tube) part of 2 6GW8 tubes I purchased on eBay. The tube tested GOOD for the Pentode section but failed miserably for the Triode section. Putting the tube into the circuit it will be used in, the tube worked just fine. I had a similar issue with a 12BY7 audio drive tube in the AM modulator of my Apache TX1. The 12BY7 test failed miserably in the tube tester but worked fine in the actual circuit.

Other tube tester results are those dealing with tubes that will be used in RF stages. I had 2 old 6146A in an HW-101 along with the HP-23A power supply that was given to me free. The HW-101 sat on a storage shelf in the previous/original owner's garage for "20+ years". Needless to say the dust collection on both the HW-101 and the HP-23a was at least an 1/2 inch thck on the top of the HW-101 and power supply After many hours of cleaning, component replacing, and thorough visual inspections in the HW-101 and HP-23A, I powered up the radio. Everythi8ng worked fine, the transmitter produced 95 watts into a 50 ohm dummy load until 5 days later when the front 6146A arced, tripping the HP-23A power supply.breaker. The PLATE meter indication showed good 50ma idling current. However on the 5th day after the transmitter was keyed for about 5 seconds the PLATE current became unstable, initially resting at 50ma but rising shortly afterwards above 50ma slowly at first then at approximately 100ma indicated on the meter, the plate current pegged the meter fully to the right and at the same time the front 6146 arced at the base of the tube, tripping the supply breaker. The tube tested GOOD in the tube tester but failed miserably in the circuit. The tube tester could not test for gas levels, only simply conduction, whether elements are shorted, and whether the filament is open or not.

No ALC on all bands or one or two? I've found the best tube "tester" is a known good working (in my case) TS-520 which I used to test my supply of drivers/finals.

Can you tune the rig up in CW even with no ALC?

Hi Mike:

I did some additional checking and it seems that if I move the driver tube while I am tuning the ALC indication comes back. I am thinking now that maybe there is a cold solder joint on the tube socket. At least I have read that can be a problem.

I believe I have to remove the board on the bottom side of the radio to get to the socket. I see there are 5 screws holding down the PC board but it didn't want to come out. Do you know what else I need to remove to get this PC board out to get access to the socket?

Thanks for your help,

There is no ALC on all bands. I cannot tune in CW either. The only thing that I think might have happened is when I was trying to remove the driver tube to test it (before I had this problem) and I had a difficult time getting the shield off. I believe I may have jarred the tube socket. I finally got the tube out by prying the shield open a little bit with a small screwdriver. This morning I read on-line that sometimes the solder connections to the socket can go bad. At one point when I move the tube in the socket side to side I did see the ALC come back. So either the tube pins are not making contact (which I cleaned with DeOxit or the solder connections on the socket need to be reheated. The only thing now is I have to figure out how to get the pc board that is below the tube socket out so I can get access to the socket's solder joints.

Hi Charlie,

It's been a little while since I was in there, but I believe the only way to get at the tube socket pins for re-solder is to remove the RF unit on which the socket resides. This is a little tricky, but not too bad if you go slowly and carefully.

You can do a Google search for 'ts-830s rf unit pictures' and you can get a good idea what's up. If you've never done it before, you can take a couple photos before removing the unit and you'll be able to use them in the event you loose track of anything during re-install.

Good Luck,
Kevin - N2FLP

Charlie.
From memory only, you can access the bottom of the RF board by removing the much easier AF board, there should be a removable panel which will give you access to bottom of RF board.

Access to the bottom of the RF board can be had by:
    MAKING SURE POWER IS OFF..AND RIG UNPLUGGED... remove the top and bottom covers...make sure no voltage is present on the HV capacitors. With the rig on its left side..or even on its top. and front facing you, remove/loosen the screw at the back corner, by RL-1. the screw may not come all the way out of the nylon spacer. Remove/loosen the screw that's between connectors 5 & 6..the side closest to the VFO..it may not come out of the nylon spacer. Remove the one screw at the front of the metal heatsink...kinda behind the IF shift/notch control. Next, remove the two screws at the chassis rail side of the metal heatsink. You should now be able to gently fold the board down/over...remove the screws that hold the plate that's now visible..and you'll have access to the bottom of the RF board. If you need to power up the rig with the board folded over...take precautions to keep stuff from coming into contact with the HV caps.

Topic: 54032 Message: 54073

After a few hours on this one, I've been down many rabbit holes from the carrier board to the generator board, to the IF board and then to the RF board. Now I'm back looking closely at the RF board.

On the TIF input to the RF board, I get a complex sine wave of about 18 mV and on the other side of the tuned circuit of T1/C67, TP2 I just have basically a DC voltage going positive and negative with transmit/receive. I don't think that's right so I'm going to see what happens when I attempt to do a bandpass filter alignment (it involves T1.)

The output of Q1 feeds the grid of the 12BY7 through a blocking capacitor and and on test point MD, the Q1 side of the blocking cap, I get +14V on receive and on transmit there is just a ripple riding on top of the 14V. That capacitor is of course going to block DC and pass AC so it looks to me like the grid of the 12BY7 never gets a positive signal to turn on the tube.

My logic (my electronics theory is still very rusty) might be completely out there so I'm open to any corrections.

54077. ts-830 voltage on finals, pin1,4,6

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-13 23:43:28 UTC
From: km4puw@...
Topic: 54077 Message: 54077

Finally got my 830 to receive properly, it was simply a loose wire on the xverter din connector. Now I am onto the TX portion. I should mention that there is still a mystery loose wire on the remote VFO din. It is the larger green wire opposite the ground (180 degrees). It is a short wire that I suspect should solder to one of the xverter pins.

I tested the voltages on the final pins. Pins 1,4, and 6 should be 0 in rx and 1.36 in tx. This rig failed that test.Screen and cathode resistors test good in circuit. The 470 ohm 1 watt on rectifier test good as well. The final cage repair has been done with parts from K4EAA
Drive tube: Looking down from top counter clockwise. Voltages taken with a standard DMM. My recent addition HP 411 has serious issues (lost that ebay gambell, but won the gambel with hp 8642B in mint condition for under $100, which by the way I will trade to a working, REALLY working 830 with mic)

Pin 1 cathode 0 VDC RX, 5 VDC TX
Pin 2 Grid -49 VDC RX, 0 VDC TX
Pin 3 ? 0 VDC RX, 0 VDC TX
Pin 4 ? 0 VDC TX, 0 VDC TX
Pin 5 ? 0 VDC RX, 0 VDC TX
Pin 6 ? 0 VDC RX, 0 VDC TX
Pin 7 Plate 343 VDC RX, 306 VDC TX
Pin 8 Screen 264 VDC RX, 232 VDC TX

Drive Tubes

Pin # Both tubes measured the same except for pin 2

1. 0vdc rx, .4vdc tx
2. 12.5vac rx, 12.5 vac tx Second tube 6.2 VAC RX, 6.2 VAC TX
3. 270 vdc rx, 251 vdc tx
4. 0 and 0
5. -103 vdc rx, -53 vdc tx
6. 0 and 0
7. 0 and 0
8. 0 and 0

Rectifier board:

300B 344 VDC RX
210B 273 VDC RX
210A (I know, but I couldn't find it) Let the haters hate.
The large choke between the final tubes has continuity.

I highly suspect that the tubes themselves are bad. Could these reading be attributed to the tubes alone?Additionally, the tubes get very hot. This is my first hybrid but it seems to me that the tubes are glowing just a bit too red, but I have no experience to make a comparison. Should they glow at all? I know that pins 1,4, and 6 should read 1.36 in tx,

can someone kindly explain where this voltages comes from and what is its purpose.

Thanks for your help.

From: Mike W5RKL
Topic: 54077 Message: 54078

A 6146 cathode voltage of 1.36VDC would indicate a 6146 final amplifier cathode current of approximately 272ma:

1.36 / 5 = .272

The 60ma final amplifier idling current will results in an approximate pin 1 6146 cathode voltage of 300mv

.06 x 5 = .3VDC

Assuming the 6146 plate and screen voltages are normal but the final tube's pin 1 voltage, with the transmitter keyed in either USB or LSB with the MIC gain set fully CCW, is found to be "0VDC" then that clearly indicates the 6146s are NOT conducting.

I recommend checking the final tube cathode resistors and verify the final tube screen voltage, pin 3 on the 6146 tube sockets, is "positive" not "negative". A "negative" final tube screen voltage will indicate the SG switch is set to OFF which will result in the 6146 final tubes not conducting, regardless of the driver tube RF signal level applied to the 6146 grids. This will not, however, result in loss of peak ALC indication in TUNE mode.

54079. Hybrid Net Update (February 14, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-14 19:54:08 UTC
From: Mark Gilger
Topic: 54079 Message: 54079

Dayton Hamvention Forum:
There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by me, WB0IQK. There were
29 stations checking in under good
conditions. There was 3 new station checking in, WB9FOP, K5IIK, and W1YEI.

We had the following number of radios checking in.

4 running TS-520(x)
2 running TS-530(x)
6 running TS-820(x)
7 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830s + Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
22 stations checking in under good
conditions. There was 8 new station checking
in: NA8I, KC0SP, W7JPG, K9EID, K0UBK, K7TGL, KD0OEC, and KD5HLB.

We had the following number of radios checking in.

5 running TS-520(x)
3 running TS-530(x)
3 running TS-820(x)
2 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
1 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday□s net total = 66, Sunday□s total = 46
December 2015, Saturday□s net total = 55, Sunday□s total = 73
January 2016, Saturday□s net total = 129, Sunday□s total = 81
February 2016, Saturday□s net total = 56, Sunday□s total = 43 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

73's,
Mark, WB0IQK

Date: Sunday, February 14, 2016, 8:41 AM

Thanks for that explanation Mike, should have came up with that on my own. Too much theory and not enough application in the field of physics for me I guess. Cathode resistors are no doubt good. Hit send again, lots of static on the speaker this time, some pretty major arcing in the tubes. Interesting, after the arching I went from 0 volts on pin 1 in tx to .495 volts in tx. Long story short, new tubes on the way.

Thanks for the help.
KM4PUW

A 6146 cathode voltage of
1.36VDC would
indicate a 6146 final amplifier cathode current of
approximately 272ma:

1.36 / 5 = .272

The 60ma final amplifier idling current will results
in an
approximate pin 1 6146 cathode voltage of 300mv

.06 x 5 = .3VDC

Assuming the 6146 plate and screen voltages are normal
but the
final tube's pin 1 voltage, with the transmitter
keyed in either
USB or LSB with the MIC gain set fully CCW, is found
to be "0VDC"
then that clearly indicates the 6146s are NOT
conducting.

I recommend checking the final tube cathode resistors
and verify
the final tube screen voltage, pin 3 on the 6146 tube
sockets, is
"positive" not "negative". A
"negative" final tube screen voltage
will indicate the SG switch is set to OFF which will

result in the
6146 final tubes not conducting, regardless of the
driver tube RF
signal level applied to the 6146 grids. This will not,
however,
result in loss of peak ALC indication in TUNE mode.

No problem Kevin. Yes there was an access cover under the AF board. When I wiggled the tube socket I could see the pins move in the holes so I resoldered all the pins well. I am still not getting any ALC in Tune or CW. I have another tube coming tomorrow so hopefully that will correct it.

Charlie,

Did you remove all old solder first, then apply New? If you didn't you didn't you may not have a good electrical/mechanical connection. Best practise is to remove, lightly sand foil then apply new solder

Are you saying the HV meter, in transmit, is showing approximate 600VDC? If so, have you measured the Rectifier Unit's "800" terminal voltage? That will give you a more accurate indication of the Rectifier Unit's final amplifier's HV supply's output voltage. You should see the same final amplifier HV supply voltage level at the top of the final amplifier RF choke in the final amplifier enclosure.

If the Rectifier Unit's "800" terminal voltage is normal, approximately +920VDC in standby, decreasing slightly with the transmitter keyed in USB or LSB mode with the MIC gain set fully CCW, then suspect one of the 680K ohms 1/2 watt or 100K 1/2 watt resistors, R5 thru R8, on the Rectifier Unit as having gone high in resistance resulting in an error in HV meter indication.

Check the 12BY7 and see if it is actually lit up. I have a Kenw00d that the connector on the driver board went bad and the tube was not getting any voltage. As far as the high voltage, it sounds like you have a bad connection on one of them or caused an issue on something nearby. Relax, things don't always go well, read the manual, check everything you have done. Try putting the old caps back in. TAKE LOTS OF DETAILED PICTURES. Brad KB2CHY

Well things are a little better now. I did find that the R5 resistor on the rectifier board was bad and replaced that and now I have 900+ volts again. Yes, the 12BY7 is lit up. What was strange is that now I cannot get any ALC on any band. I think I am going to check the solder connection on the bottom of the 12BY7 socket again. When I first got the radio last week no problem with the ALC then after trying to get that darn tube shield off I believe I may have broke free a solder connection on the socket. I was able to access it through the door under the AF board rather easily but I am now wondering if maybe I may have created a solder bridge or something.
I tested all the resistors on the rectifier board and they are all ok now. I am not going to let this beat me!

Thanks for all the help,

Charlie W3DDF

Resistor R5 on the Rectifier Unit is part of the HV meter circuit only. Resistor R5 has nothing to do with nor does it have any effect on the actual level of HV found on the Rectifier Unit's "800" terminal and the level of high plate voltage applied to the 6146 plates.

Howard,
Chances are that there is a burr on the shaft. I've seen this several times. There are several ways to get it off. Try this first: rotate the shaft/knob all the way to one end of the VFO range stops. remove the set screw totally from knob, put a drop of light oil in the hole...while using a LIGHT outward pulling and at the same time rotating the knob(keep VFO at its stop) try and get it off the shaft....BE GENTLE. The other involves removal of the VFO and...let's not go there yet. When you get the knob off...inspect the shaft...most likely the burr will be where the set screw bites into the shaft. It can be fixed with a very fine file or very fine sandpaper...just go easy.

If the knob just quite won't slide off you might try a "gentle side to side rocking" motion while gently pulling on the knob. This works especially when there's a very small burr that just will not let go.

When removing burrs on a shaft using a file, file the entire circumference of the shaft, not just where the burrs are. This keeps the shaft as round as possible.

Also, check periodically to see if the knob slides easily onto the shaft. If it doesn't slide easily onto the shaft then check to ensure the set screw is not protruding into the knob's shaft hole. Also, look closely as you slide the knob onto the shaft. If the knob will not go onto the shaft, there may be a slight lip edge that needs to be removed. I have run across this before, not as often as finding large burrs and deep cuts on and into the shaft.

When all the filing is done, the knob slides easily back onto the shaft, position the knob, not fully onto the shaft, but a slight distant away from the front panel and mounting nut then tighten the set screw just enough so the knob does not slip as you rotate the knob. Band switch knobs are the most difficult to get tight. Remember, you are not tightening head bolts on an engine or bearing caps on a piston's connecting rod!!!

Some set screws are slotted requiring a small flat blade blade screw driver while others may be 5/64" hex set screws. You may run into a few that have Bristol set screws, Collins use Bristol set screws which require the proper size Bristol wrench. Do NOT attempt to remove a Bristol set screw with an Allen Wrench, you can and most likely WILL permanently damage the Bristol set screw. When this happens you WILL have a difficult time removing the Bristol set screw!!!

If the burrs on the shaft are significant then you may have to start with a small second cut hand file then switch to a small smooth cut hand file. Use common sense when selecting the type of file you need and remember, the shafts are made of Aluminum, they can easily be damaged if you do not take your time and pay attention.

It is always best to go back and review work that was just performed anytime radio did operate and now doesnt operate after performing that corrective maintenance task. About 95% of the time you will find that you are in rework space. It can happen to anyone.

However, after retracing your steps (in this case reflowing the tube socket pin soldering) and radio still doesnt work it is about time to run TX Level Diagram to see where RF drive is low or missing. This assumes you have verified you now have all the proper voltages restored to the Driver tube. I do that with a Pomona test socket, but if careful can do it at the top side of RF board. If you have trouble can just pull the tube for easier access to take the voltages.

Pay special attention to the control grid. Tube is running Class A so operating bias will be low around positive 0.4vdc or so. If not switching from cutoff bias to operating bias wont have any RF drive at Plate or DRV. RL-1 aux relay is often culprit here.

I have posted here more times that I can count how to run TX Level Diagram. It bemuses me how many people dont use this invaluable tool. If you start at the control grids of the Finals should see approx 47 rms RF volts and approx -60vdc operating bias. If you have less RF voltage swing than this then will have no ALC indication. If bias isnt switching from cutoff to operating level then no ALC indication. If zero signal plate current is at 60ma then operating bias isnt the problem, but I like to measure it along with the RF drive voltage.

This situation is ideal opportunity to learn how to use TX Level diagram. There are some nuances and instrument effects you need to recognize. Cant get there if dont try. In lieu of 20 meters you may want to run them on 80 or 40 meters around 200 on the VFO to lessen instrument effects on the Driver tube grid (mixer) and plate (drive) tuned circuits. Remember if not using RF millivolt meter or an O-scope must use a multi diode rf probe like a Heath PK-3 to measure RF voltages at Drive tube plate, DRV, and Finals control grids. Single diode probe is fine for TX Mixer output. Need O-scope for TIF. TIF will be harmonic rich if your scope doesnt have low pass filter capability due to VCO or HET LO leak back (depending on hybrid model). In your case no likely that TIF is the problem unless you disturbed Molex Conn 7.

54097. TS830: Low power and no reaction to "DRIVE"

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-19 15:02:59 UTC
From: Martin Jangowski
Topic: 54097 Message: 54097

Hi folks,

my TS830 got bad today. After switching it on today I noticed low output on the band. This is what I found:

On 20 and 15m:

* RX working fine, clear noise max when turning DRIVE
* ALC maximum in TUNE well defined and sharp
* in CW: maximum output power into dummy load about 40W
* Ip starting with about 200mA (LOAD fully CCW), easily going >250mA
* meter shows about 800V HV

On 40m:

* RX bad (strong stations about S4-S5), no noise max when turning DRIVE
* No reaction to DRIVE (in RX and TX)
* No ALC in TUNE (regardless of DRIVE, CAR and PLATE)
* no output in TUNE (normally 5W)
* Minimal output power in CW (needle of AT230 just moving a little bit)

First thing I checked are DRIVE chains and variable caps, everything fine and without play. The white plastic couplers are both intact and working fine. Insides of HV cage clean and shiny, nothing obvious burned or charred. When I overhauled the 830, I cleaned and checked the band switches, no obvious difference.

Any ideas where to start?

Martin DB2MJ

The Collins 30L-1 has a built-in antenna change-over relay. When the AC switch is off, the exciter RF (TS830S) passes through the relay and is connected to the antenna.

If you're asking about antenna relay switching line control, the Collins 30L-1 supplies 120 volts DC to control the internal antenna change-over relay. There is no reason to add an external relay line box to control this line. The TS-830S internal relay contacts that control this line can handle the voltage and current. I've used my TS-830S internal relay to control the Heath SB-200 antenna relay control line (-130 V DC) since 1983 and never had a problem.

Your VFO range is a little off. You can adjust it according to #7 of the service manual (VFO check and adjustment). This is no fun, because the two adjustments are not independend. You set the lower setting, turn the VFO up, set the upper setting, turn the VFO down, check the lower setting.. it's off. You set it, turn up etc. Hours of fun....

You have a working counter, use it and adjust the dial with the marker signal (MIC to lowest setting, there's a switch) if you need the dial.

Martin DB2MJ (using his spare and fully functional TS520, because the 830 is dead)

54105. Progress>> Re: Symptom - no ALC indication in tune/send

Topic: 54032 Message: 54105

Dummy - not a dummy load but dummy me.

I have been way, way off-track with my troubleshooting and learned a valuable lesson this morning. I have been operating under the premise that my lack of ALC was a result of no drive, that is not the case at all. I had a chat with a ham buddy yesterday (retired EE with a shack full of boat anchors) and discussed my troubleshooting procedures and after our chat, I had an action plan.

The action plan was to forget the scope for now and use my Fluke 179 DMM with a Fluke #83 RF probe to measure RV voltage starting at the grid of the final and working back. To validate my Fluke I measured RF voltages on the level diagram on a working 520s and made notes.

Here's my RF readings on the good 520s starting on the right side of the level diagram in the service manual and working left, factory RF volt levels are in ():

V1 pin 5 -> 46.28V (35V)
RF unit "DP" -> 59.5V (49V)
RF unit "MD" -> 1.87V (1.70V)
RF unit "TP2" -> 0.24V (0.18V)
RF unit "TIF" -> 0.014V (0.038V)
IF unit "TP1" -> 0.0267V (0.041V)
IF unit "GEN" -> 0.864V (0.23V)

My project 520s with no ALC:

V1 pin 5 -> 35V (35V)
RF unit "DP" -> 37V (49V)
RF unit "MD" -> 1.78V (1.70V)
RF unit "TP2" -> 0.15V (0.18V)
RF unit "TIF" -> 0.018V (0.038V)
IF unit "TP1" -> 0.013V (0.041V)
IF unit "GEN" -> 0.553V (0.23V)

My mistake was not looking at some voltages around the RF board while TUNING THE DRIVE control to see if anything rose in value Dummy-dummy-dummy! I got a good drive peak and was able to get 30 watts on the Bird with about 180 ma of plate current after adjusting drive/tune/load.

So, I can focus in more on my issues:

No ALC indication
Low RF voltage on the plate of the driver
Low RF output, low Ip on the finals (related to low RF on the driver plate maybe?)

I'll recheck all DC voltages around the driver and see what we have. Oh, BTW - it took me about 8 hours to remove and re-install the RF board. I wanted to look the trace side over

carefully and I resoldered the variable caps and the driver socket.

54106. 830 no ALC or volume

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-19 20:09:48 UTC
From: John Rouse AD5CO
Topic: 54106 Message: 54106

Hello group,

Opened up my 830 to tighten up the band switch shaft coupling, confirmed it was aligned with the contacts,
also applied some DeOxIt to all the contacts on the band switch due to an intermittent, no output
problem I'd had that was starting to really get annoying, I would have to flip the band switch back and forth a
couple of times and the problem would go away.....for a while, now that I've fixed my beloved 830, I have no ALC or reception / volume on any band (dead)?
Everything else appears to be ok. Maybe someone in the group could point me in the right direction and I can get it working again.

Thanks
John

One problem easily solved - I changed out the 12BY7 and now I'm at a nominal 48V of RF on the 12BY7 plate. We came up 11V of RF with a different tube . Now I can focus on the ALC/output issue.

The amusing thing is this 520 isn't in great cosmetic condition (the chassis is in rough shape in a few places) and I wasn't intending to sell this, it's just a training mule for me. I should have picked one of my 520s to work on that had some resale potential.

I hate this. Removed upper and lower case parts, set the radio in
service position, started to check voltages etc... everything works
fine. No problem getting ALC at all bands, plenty of power (I got a Bird
43 with several slugs this week, first measurement....), RX just fine.
Reinstalled lower and upper half, works as usual.

I don't like spontaneous remission in electronic gear!

54109. Heater switch

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-20 14:45:01 UTC
From: bsa0791@...
Topic: 54109 Message: 54109

Seems like I remember reading that the heater switch really has no value on the hybrids. Is this correct? Is there any tube preservation occurring with the switch off. I listen for long periods of time and was wondering if I should bother with cutting it off. How much warm up time should I allow when activating the switch?

Thank

Brian KB4MNG

54110. Re: [TS-520_820_530_830] Heater switch

Yahoo group: TS-520_820_530_830 (2015 — 2016)

From: Mike W5RKL
Topic: 54109 Message: 54110

Brian,

The GE data sheet link below provided the typical filament warm up time
for the 12BY7 driver tube is 11 seconds:

https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&cad=rja&uact=8&ved=0ahUKEwiE4dTX0IbLAhUBVSYKHdiRAAQQFggcMAA&url=http%3A%2F%2Fwww.r-type.org%2Fpdfs%2F12by7a.pdf&usg=AFQjCNG8dPWjSa4KYqhFqWY5G_3pZpxJeg&bvm=bv.114733917,d.eWE

The RCA data sheet link below provided the typical filament warm up time
for the 6146B final tube is 60 seconds:

https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=2&ved=0ahUKEwjHuZLvzYbLAhXL4yYKHawpAh0QFggjMAE&url=http%3A%2F%2Fwww.n6wk.com%2Fkenwood%2F6146B%2520RCA.pdf&usg=AFQjCNGhDsueFpiDzjQyHpJGD2oalphntg&cad=rja

I would allow 90 seconds filament warm up time before attempting to
transmit. This provides sufficient filament warm up time so the filament
stabilizes.

As for whether you should set the HEATER switch to OFF or ON when only
receiving for long periods of time, is entirely up to you. Leaving the
HEATER switch turned ON will not damage the tubes or cause problems with
the radio. There are suggestions that the HEATER switch was put there to
be used, set to OFF, when operating from a DC power source (car or
truck) in order to save battery power. That's true when operating from
battery power. However, most KW hybrids operate from house/home power,
either 120VAC or 220VAC depending on the AC power source voltage.

The answers to many questions such as these can be found by using your
favorite search engine and a simple common sense search phrase such as

"12BY7 data sheet"
or
"6146B data sheet"

I also have tube manuals on my website

http://w5rkl.com/manuals/

The tube manuals provide the schematic symbol for each tube, show how
each element is connected to the pins, the pin numbering/orientation
looking at the bottom of the tube, and what each element is.

The manual also provides data pertaining to the maximum AC/DC filament
voltages, whether the tube can be horizontally or vertically mounted,
maximum grid voltage, maximum screen and plate voltages for specific
applications the tube will be used for including CCS (Continuous

Commercial Service) or ICAS (Intermittent Commercial and Amateur Service) maximum voltage, current, and wattage levels.

In addition, the tube manuals include tube specifics on inner-electrode capacitance values.

A tube manual for ham/technicians who will be servicing their ham gear that contain vacuum tubes, is a must have reference book. You can download from my website or purchase tube manuals on eBay.

Hello Group,

Through my haste to removed the top cover, I forgot to disconnect the speaker cable and jerked it and the cable harness it was tied too,
which in turn pulled out one of the plugs on the board under the PLL unit that I could not see. It looked like it was plug in, but a closer look revealed that it wasn't.
Now my beloved 830 is back to life.
While trying to solve the problem, I also found a couple of problems, one of the male cable plug connections on the IF board was loose,
and two of the wires on the final board were also loose. These are great old radios that do need a little TLC from time to time.

John

Topic: 54098 Message: 54113

Tom,

Building your own relay system is the best way to learn.

As for the ALC connection between the TS-830 and the 30L1, I recommend
you make that ALC connection!

If you do not have the 30L1 manual you can download it at the following
links:

https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&ved=0ahUKEwjmpuCWo4fLAhVB6yYKHczRDCEQFggdMAA&url=http%3A%2F%2Fcollinsradio.org%2Farchives%2Fmanuals%2F30L-1-Manual_5th-ed-06-62_Sec1.pdf&usg=AFQjCNEppVFhXmwe3gBmHc5COM3kFM-XlA&cad=rja

and

https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=2&cad=rja&uact=8&ved=0ahUKEwjmpuCWo4fLAhVB6yYKHczRDCEQFggjMAE&url=http%3A%2F%2Fcollinsradio.org%2Farchives%2Fmanuals%2F30L-1-Manual_5th-ed-06-62_Sec2.pdf&usg=AFQjCNEw7AQgtxpXDDTKu2BbKKrqq7rDog

If you have the 30L1 operator's manual turn to SECTION II "OPERATION"
and read paragraph 2.2 "OPERATION WITH OTHER MAKES OF EXCITERS".

The 30L1 manual shows how to connect the 30L1 to Collins
transmitters/transceivers. Connecting the 30L1 to the TS-830's ALC
connection you will need a DIN plug (see the TS-830 USER manual to make
the correct DIN plug remote ALC input connections and ground).

Date: 2016-02-21 19:28:52 UTC
From: bucket@...
Topic: 54032 Message: 54118

Another discovery today, the S meter won't calibrate so something is really screwed up somewhere in the metering circuit (which runs all over the place.) And yet one more discovery, R51 (220k) on the base of Q8 (IF board) was replaced with a jumper wire. At first I thought - ah-ha, somebody hacked a fix so I plugged in a 220k resister and that made what S meter reading I had (with 14.175 Mhz at 0dBm coming in the back) disappear. I didn't like the out of circuit test of the Q7 N-channel FET (2SK19) so I tried to replace it with a J310 and that didn't work at all.

So R51 was was removed by Kenwood at some point and replaced with a jumper sometime after my service manual was printed.

I did manage to get 100 watts out of the beast on 20 meters with good plate current so at least that part of the rig is working okay, so that's a bit of an accomplishment. But, it's time to give up on the tired old darling. I must have 20 or 30 troubleshooting hours into this particular unit. Didn't repair the primary problem but I certainly learned from all of those hours invested.

What I need to do when checking out a 520 (or whatever) is completely verify all functions are working (or not.) I got hung up on the first major issue I observed with this unit - no ALC and went off on a tear. I also think doing a calibration right off the get-go would be helpful to check the overall condition of the unit.

Time for a break from the 520's - I need to get in my shop and get busy on my lathe for a machining project I've been delaying while trying to fix this old girl.

54119. Hybrid Net Update (February 21, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-21 23:59:36 UTC
From: Mark Gilger
Topic: 54119 Message: 54119

Dayton Hamvention Forum:
There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by me, WB0IQK. There were
22 stations checking in under good
conditions. There was 4 new station checking
in, WD4HBC, KC4ZTD, KB0WZ, and KD9PHL.

We had the following number of radios checking in.

8 running TS-520(x)
1 running TS-530(x)
2 running TS-820(x)
8 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830s + Drake L-4B amplifier.

The Sunday net was run by Jimmy, WB2KNR. There
were 14 stations checking in under good
conditions. There was 4 new station checking in
KK4DDK RICK, KD7HH ROGER, and KB0WZ DALE

We had the following number of radios checking in.

5 running TS-520(x)
1 running TS-530(x)
1 running TS-820(x)
1 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

He was running his TS-520 + Heathkit SB-200 amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday□s net total = 66, Sunday□s total = 46
December 2015, Saturday□s net total = 55, Sunday□s total = 73
January 2016, Saturday□s net total = 129, Sunday□s total = 81
February 2016, Saturday□s net total = 78, Sunday□s total = 56 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

54120. low noise from 830S when doing CW full power

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-23 16:22:01 UTC
From: Martin Jangowski
Topic: 54120 Message: 54120

Hi folks,

I'm using an automatic keyer to check conditions via RBN. I tune the 830 to a frequency in the lower 40kHz of a band, switch to CW, toggle "send" and start the keyer. The keyer stops after a few "test rbn"-loops, so I turn down AF volume after the start of the keyer. On 15m I hear a rather low buzzing sound from the inside of the TS830 in sync with the CW signs. I think I smell a little ozone, but this could be pure imagination. Can't hear or smell anything on the lower bands doing CW via the keyer, just a little hum from the transformer.

Any idea what this could be? The rig works flawlessly...

Martin DB2MJ

54121. Kenwood JR599 USB 3396.5 kHz Crystal

Topic: 54121 Message: 54121

Hi All,

I am looking for the above carrier xtal for my Kenwood JR599 RX.

The part number is L77-0122-05.

It is used by a number of the older Kenwood rigs (TS510 & TS520). Also some of the Heathkit models.

This part is no longer available from Kenwood as the RX dates from the 70's.

Hopefully there is somebody with a xtal that will complete the restoration of this classic RX.

If not maybe they can give me details of the xtal specifications and I will order a new one.

Hi Ned,
If you can't find someone who has one, contact Sara at International Crystal Mfg in Oklahoma City (1-800-322-9426).They have specs for just about everything. They are a ham owned and operated business and have a LOT of respect in the ham community.I have bought a few xtals from them and been quite happy. I think mine were around $30 each, shipped. It seems like a lot but consider this. I have a Drake price list for crystals in 1968 and they were $5 each. That comes out to be around $34 in 2016 dollars. The crystals are made to order. They quoted about 4 weeks delivery and I got them sooner than that.
73,
Bill, WA6NEQ

  Hi All,

I am looking for the above carrier xtal for my Kenwood JR599 RX.

The part number is L77-0122-05.

It is used by a number of the older Kenwood rigs (TS510 & TS520). Also some of the Heathkit models.

This part is no longer available from Kenwood as the RX dates from the 70's.

Hopefully there is somebody with a xtal that will complete the restoration of this classic RX.

If not maybe they can give me details of the xtal specifications and I will order a new one.

73 de Ned/EI5DS

Hi Ned,

This is Walter Dilley. I have the Hybrid Inventory of parts for our old radios. I have a parts board with that crystal (L77-0122-05) you need. I can pull it and send it to you. If interested, please contact me off list.

Thanks,
Walter, kd7dny

Bill and Ned,

The price International Crystals charges for a 3.395Khz crystal is much higher than the $30 you stated. While you can buy crystals from International Crystals with frequencies of 5Mhz and higher for $25 plus shipping, crystals with frequencies below 5Mhz are much more expensive. I was told that price by Sara Gore when I was looking to buy a new LSB BFO crystal for an Allied SX190 receiver I was repairing.

Crystals such as 12.395Mhz, 15.895Mhz, and above for KW hybrids are still priced at approximately $25 plus shipping, unless their prices have gone up since my last conversation with them last year.

Gotta get back to making my video on how to power,test, (outside of the KW radio), and clean a KW hybrid TS-520 VFO.

Yes, the price for crystals below 5Mhz has sky rocketed. I was needing a 456Khz crystals and during my conversation with Sara that's when she told me the high price for crystals below 5Mhz. I ended up building a small 455Khz BFO oscillator using a small cheap 455Khz Resonator I picked up from a Chinese eBay seller (the sale was for 5 resonators for $1 with free shipping). That was much cheaper than the $50 for the crystals. I built the oscillator on a small perf board and a few other components and an MPF-102 FET. The oscillator was powered by the receiver. It worked very well and the oscillator's small 100pf variable capacitor allowed the oscillator to be adjusted to 456Khz, exactly the frequency needed for the LSB BFO, worked great and it is still working today.

I hope I am sending this to the right place. I have a TS520se and it has been doing fine. Today when I started tune it up I had a problem getting output. I did the common procedure to start tuning, tune and alc; plenty of drive. Tune and Ip; good dip. CW and RF; I got just a little power and then it fell off. I tried again and the power was down to zero. Do I need new finals (6146) or could it be the driver tube, 12by7 (or whateve the name of that tube is). Thanks for any help.

KQ5O, Luther

Dropping output when you key up for a few seconds tends to mean your driver tube is soft. I'd give that a try first before jumping straight to finals.

Dale,

You could always experiment building a simple 500Khz oscillator using a 500Khz ceramic resonator.

There's an ebay seller who is selling two 500Khz ceramic resonators for $1.05 plus $3.53 shipping under ebay ad #361485040886.

Another ebay seller is selling "100" 500Khz ceramic resonators for $4.45 "Free Shipping" under eBay ad #301835885228.

I built a 456Khz LSB BFO oscillator using a 455Khz ceramic resonator to replace an expensive 456Khz LSB BFO crystal. The oscillator is used in an Allied SX190 solid state ham band only receiver. Cost to build the oscillator was less than $10.

Just a suggestion.

The heater switch is for reducing battery drain if you are mobile or in an off-grid situation running on solar & storage batteries. You can listen to the bands and just turn on the filaments if you want to make transmissions in a net etc....It takes about a minute to heat the tubes up to transmit. I actually ran my TS520 mobile many times when it was new. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

54140. ts-830 Screen Grid Voltage

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-26 00:24:40 UTC
From: km4puw@...
Topic: 54140 Message: 54140

Once again before the alter of ignorance. I am having what was an intermitant problem with screen grid voltage. When the radio first came on, before warm up, I only had 135 volts on pin three of the finals. No tx power. Once warmed up the sg voltage would magically jump to around 265, with RF out, but "static" through the speaker and ALC pegged hard. Sounds like electrical arc interference coming through the speaker, never observed any flashes. Turned it off for a time, came back to it, flipped send for a millisecond, POP, blue smoke released from something. Now a permanent 135 volts on sg, no rf output. Screen grid resistor new and good, cathode resistors new and test out at 5.3 ohms.

On the rectifier board, l1 seems burned. One side of L1 is at 135 volts, the other was 0. The SG switch has been cleaned and seems to be ok. Any suggestions as to where I should look next?

Thanks for all your help, I have learned more about electronics this past few weeks then I did in four years of getting a fis-x degree. 6146B tubes are new as well.

Chris,

If this is what I think it is, it's just a kind of dope like finger nail polish the KW folks put over screws to set them after assembly. It's brittle and when I encounter it, I just back the screws out with no apparent sticking or damage. I'm not sure how you'd remove it or whether you really need to.

Bruce I hope this finds you well. I used LEDs to replace the meter lamps. It is a fairly straightforward process but does require some disassembly. I used amber(my preference for night work) and depending on the LED current anything from 1/8 watt 470 ohm to 680 ohm series resistor is fine. Communication Specialist's ss64 ctcss board (28.95 at 2013 prices) worked fine. They even have an ap-note on their site for the 7400. Good Luck & great fun with this loveable old rig. Same personality as the hybrids and same durability. Yours in the fraternity,Mike K8SYN

It's probably the same stuff I bought years ago (in green and amber) to paint dial lamps. It was in a nail polish-like bottle with a nail polish-like brush. It will probably come off with acetone or nail polish remover.

If I was at home at the moment, I could try it as I still gave those bottles of bulb dye. :)

I notice that some 830s have a power cord that is hard wired and some that are using a Jones connector. Was the hard wired power cord used in later serial numbers radios or was the Jones connector cord?

Charlie,

According to the TS-830S/M service manual parts list page 9 the rear panel 12 pin male power connector part number E08-1202-05 and matching 12 pin female power connector part number E08-1207-05, was used on the TS-830(M), TS-830(T), and TS-830(W) models only.

The use of the 12 pin male and female power connector provided 220VAC or 240VAC AC mains power by wiring the 12 pin female plug according to the TS-830S/M service manual and selecting the proper 220VAC or 240VAC AC mains power switch on the rear panel. This can be seen by viewing the TS-830S service manual schematic. I have the TS-830S,M service manual on my website

http://w5rkl.com/wp-content/uploads/2014/04/TS-830_Service_manual.pdf

that shows the 12 pin male and female wiring and rear panel AC main power switch settings (see left side of the schematic in the TS-830S,M service manual page 63).

The heater switch is for reducing battery drain if you are mobile or in an off-grid situation running on solar & storage batteries.

You have to "load up" the transmitter in TUNE or CW mode, SSB mode. produces no power output without aucio input to the mic.(Basic radio knowledge), Do you get peaks of RF output and plate current when speaking into a good microfone ???? My radio is Ham Radio...CW is Real Radio 73, John...K8JD

  TS-520 in new condition (not been on air since 1978) loads up on tune and cw,but wont load on either sideband.
Other wise it tunes up fine.   On ssb needle burys to the left on ssb transmit, but no pwr output.

If the plate current is not resting at 60mA when you are transmitting in the SSB mode you have other problems. If the output is good in CW mode, you may have mode switch or grid bias circuit problems to deal with. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Hi Chris,
The green stuff usually snaps loose when you turn the screw. Acetone on a q-tip may dissolve it if you prefer, but if you carefully place the tip of a soldering gun on the head of the screw and heat it just enough for the green stuff to become soft at the screw it can sometimes later be used over to lock the screw again with a little heat, if desired.

I've had to use this technique to remove seized screws or screws that were unreachable to apply adequate torque, that were driven fast and hard into plastic, such as on vehicles, to remove the screws without damaging the plastic mounted under the head of the screw.

I am having a similar problem with audio on my 520SE. It will work fine for awhile, then with no one touching the rig, the sound in the speaker and audio jack cuts out. If I flip the switch from usb/lsb to cw i get audio back only to loose it again when i return to usb/lsb. I can flip bands with no sound on any bands. With no one touching the rig audio will suddenly.return, sometimes it will return when various switches are turned. I am getting audio because the meter needle continues to bounce. Its frustrating, and i feel your pain.

Hams more experienced than me in my club suggesting cleaning the switches and looking for unsoldered connections. I thought I would pass that info on to you, just in case it might help. Please let me know if/when you find a solution. Good luck!

Hello Group,

Through my haste to removed the top cover, I forgot to disconnect the speaker cable and jerked it and the cable harness it was tied too,
which in turn pulled out one of the plugs on the board under the PLL unit that I could not see. It looked like it was plug in, but a closer look revealed that it wasn't.
Now my beloved 830 is back to life.
While trying to solve the problem, I also found a couple of problems, one of the male cable plug connections on the IF board was loose,
and two of the wires on the final board were also loose. These are great old radios that do need a little TLC from time to time.

John
AD5CO

Hello group,

Opened up my 830 to tighten up the band switch shaft coupling, confirmed it was aligned with the contacts,
also applied some DeOxIt to all the contacts on the band switch due to an intermittent, no output
problem I'd had that was starting to really get annoying, I would have to flip the band switch back and forth a
couple of times and the problem would go away.....for a while, now that I've fixed my beloved 830, I have no ALC or reception / volume on any band (dead)?
Everything else appears to be ok. Maybe someone in the group could point me in the right direction and I can get it working again.

Thanks
John
AD5CO

After 30 plus years, that coating should be brittle and a little torque on the screw or nut will break it free. The coating is similar to the colored glazing paint you can buy in a craft store. It's the same stuff we use to use to color panel lights (green, red, blue, etc.). Nail polish can be used lightly on the hardware to keep it from loosening after reassembly if desired.

Dayton Hamvention Forum:
There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by me, WB0IQK. There were
20 stations checking in under good
conditions. There was 4 new station checking
in, KM4KZV, W4GCH, N8GIG, and KC8YUP.

We had the following number of radios checking in.

3 running TS-520(x)
1 running TS-530(x)
4 running TS-820(x)
4 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830s + Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
14 stations checking in under good
conditions. There was 4 new station checking in
KK4DDK RICK, KD7HH ROGER, and KB0WZ DALE

We had the following number of radios checking in.

5 running TS-520(x)
1 running TS-530(x)
1 running TS-820(x)
1 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
1 running TS-900

He was running his TS-520 + Heathkit SB-200 amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday□s net total = 66, Sunday□s total = 46
December 2015, Saturday□s net total = 55, Sunday□s total = 73
January 2016, Saturday□s net total = 129, Sunday□s total = 81
February 2016, Saturday□s net total = 98, Sunday□s total = 72 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo

I have a couple 7400A 2 meter transceivers. Yes, most repeaters require a PL tone for access. There are a number of websites that show how one can build a simple PL tone encoder using inexpensive components or where one can purchase inexpensive ready made tone encoders to make those older 2 meter FM transceivers that do not have a built in tone encoder, useable with modern FM repeater systems.

http://www.angelfire.com/electronic2/qrp/pltone.html

https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&cad=rja&uact=8&ved=0ahUKEwjCt9b9hp3LAhXD4SYKHbfJAmIQFggdMAA&url=http%3A%2F%2Fwww.rollanet.org%2F~rrars%2Ftech_files%2Fpl_tone_ckt.pdf&usg=AFQjCNEc6VX07W-neEFDvF6kk_Wtya3iug

http://www.amazon.com/Ramsey-Tone-Encoder-Decoder-Kit/dp/B0002NRLB6

http://www.aesham.com/tone-boards/ctcss/communication-specialists-ss-64/

The instruction sheet for the SS-64 tone encoder is available for downloading in pdf format at the following link:

https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=2&ved=0ahUKEwjMhaCSiZ3LAhWISyYKHQlABFMQFggjMAE&url=http%3A%2F%2Fwww.com-spec.com%2Finsheet%2Fss64inst.pdf&usg=AFQjCNHXTp9CNxMCjTcYbBVyA3FDo4_fsQ&cad=rja

Regardless of the tone encoder used, the output of the tone encoder should be adjust just to the point where the repeater recognizes the tone and does not produce over deviation of the 2 meter transmitter. Use a simplex frequency, 146.52Mhz, when adjusting the tone encoder's output or a VHF 50 ohm dummy load. If you have a modern 2 meter transceiver such as for example an FT-857D (other modern 2 meter transceivers with built in tone "decoder" can be used the same way), set the modern receiver's built in tone "decoder" to the required repeater PL tone. Key the older FM transceiver and adjust the tone encoder to the repeater's PL tone then adjust the encoder's "output" to the point where the modern 2 meter receiver opens squelch then stop adjusting the tone encoder's output! Rekey the older transceiver a couple of times, the modern FM receiver should open squelch every time. Speak into the older FM transceiver while listening to yourself in the modern transceiver, the receive audio should be clean, not distorted. If the receiver audio tends to cut out then the older transceiver's tone encoder's output is set too high. Do not connect the tone encoder to the microphone input as that can easily cause over deviating of the FM transceiver causing problems when attempting to access the repeater in question.

The tone encoder connects to the FM transceiver's deviation pot, NOT the mic socket!! Follow the encoder's instructions and do NOT guess or assume the encoder's set properly, verify it!!

Many older FM transceivers live a life as an APRS transceiver (Automatic Packet Reporting System), a 2 meter digital mode I personally never cared for but that's me. Using a separate tone encoder, that older FM transceiver you have collecting dust in your basement or garage that does not have a built in tone encoder, can now be used with most 2 meter FM repeaters.

Mark - you missed me as a new check-in on the Sunday net . I was going to use my 830 for the net but with my wire antenna you guys were almost in the noise and it wasn't going to work. I'm going to recap the 830 and align it - hopefully my rcvr sensitivity will some up some.

So I used my Elecraft K3s which has such a good receiver and DSP noise reduction I could easily pull almost everybody out for good copy. (Amazing technology improvement in 25+ years!)

Thanks for running the net, it was fun and hope to catch you guys next weekend.

Hello i am new here.
I have ben given to me a TS-520 from an old ham here in Portugal and i will
be active son on work for a few years on the Azores islands.
In subjet of the ts-7400a there is a whay to install a board, here is what
i came across a few years ago
http://forums.qrz.com/index.php?threads/adding-a-tone-board-to-a-kenwood-7400a.372275/

I hope it helps.

Luther,
If you do not have them already, you will need the TR7400A User and Service manuals. I have both of them on my website in pdf format for downloading:

The TR7400A service manual link:
http://w5rkl.com/wp-content/uploads/2015/02/TR7400A-servoce-amia.pdf
The TR7400A user manual
link:http://w5rkl.com/wp-content/uploads/2015/02/TR7400A-Users-Manual.pdf
You need to spend time studying those manuals BEFORE you attempt to install any PL tone circuit to your TR7400A. Don't just "thumb through" the manuals but rather read and study them.

Jim,
The TS-900 has the same 3.395Mhz IF and quite possibly uses the same CW filter as used in the KW hybrid TS-520 and TS-820 models. Inrad makes a nice CW filter for the 520 and 820 models but I recommend you ask INRAD first to be sure.

54180. TS-820S, Cannot zero "S" meter

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-02-29 18:51:58 UTC
From: Dave
Topic: 54180 Message: 54180

Greetings;

Looking for some collective wisdom for this problem.

History: Original problem; broken bandswitch coupler. Replaced same, aligned bandswitch. Operation restored BUT
noticed fluctuations in receiver gain and ALC; at some settings ALC went into slow oscillations.

Found that Q4 on the X49-1150-00 IF PWB was intermittently (ugh) bad. Replace same with original type. ALC and AGC now stable. Carrier and receiver stable.
Output and modulation within normal limits allowing for PA aging.

BUT

"S" meter won't zero! ALC control seems to be a bit non linear. Q5 bad?

Suggestions?

Dave, W5WP

Joe and Jim,

I noticed I mistakenly said a TS820 has a 3.395Mhz IF which is wrong.
The 820 has an 8.830Mhz IF. Sorry for the mistake in IF frequencies.

54182. "Blistered" 6146B's

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-01 00:26:35 UTC
From: bobcolenso@...
Topic: 54182 Message: 54182

I originally posted this on QRZ and someone suggested I also post it here (I should have thought about that first).

My SWR is perfect, and my tune-up procedure is "sane".

_____
Hi all,

I have a TS-830s. The other day I was on 15 talking with a guy in Texas, when all of a sudden the plate current went sky high and it popped the main fuse.

Upon examination, I found that on one of the 6146's the (is that the PLATE you see when looking inside the tube?) has considerable "blistering" on it. There are two areas that are blistered, along two of the 90° bends and 2-3 mm on both sides of the bend. A visual and olfactory inspection is all I have done, and this is all I can find.

So my question; is it possible that the tube just failed and this is what happened? Or was there an underlying reason for this to happen like some other component failure or something I did wrong? The tubes are about ten years old, but don't have all that many hours on them.

Thanks,
Bob--KD8WU

Bob:

Before replacing both Final tubes I would confirm that the Control Grid Pin 5 cut-off and operating bias voltages measured at the tube socket pin are to spec. Make sure everytime you flip to Send the bias voltage switches from approx -100vdc to -60vdc and is stable. Slowly move the bias voltage adjust pot back and forth and make sure you dont lose the -60vdc.

I would also clean the bias voltage adjustment trim pot inside the PA cage with Deoxit D5 and exercise it multiple times and I like to apply small amount of Fader lube (optional).

If all is well install two new tubes and adjust zero signal plate current in SSB mode with mic gain turned down to 60ma. Then load on 28.8mhz and neutralize.

Terry K9TW

Sounds like an arc to the plate. The ones I have seen have a "glassy look" or a bright spot where the plate has momentarily melted.

Probably the tube slowly leaked air and went gassy. No fault of yours, just the tube aging badly.

You will want to look for damage caused by the arc (damaged cathode resistors for instance) before replacing the finals.

Dave,

sounds very strange. However, have your tried cleaning or moving VR2 on the IF board. I just had an 830s on the bench where I couldnt adjust it. A little electronic cleaning fluid a few turns and compressed air and it was working again

Subject: [TS-520_820_530_830] TS-820S, Cannot zero "S" meter

Greetings;

Looking for some collective wisdom for this problem.

History: Original problem; broken bandswitch coupler. Replaced
same, aligned bandswitch. Operation restored BUT

noticed fluctuations in receiver gain and ALC; at some settings
ALC went into slow oscillations.

Found that Q4 on the X49-1150-00 IF PWB was intermittently (ugh)
bad. Replace same with original type. ALC and AGC now stable.
Carrier and receiver stable.

Output and modulation within normal limits allowing for PA aging.

BUT

"S" meter won't zero! ALC control seems to be a bit non linear. Q5
bad?

Suggestions?

Dave, W5WP

Dave,

Have you checked the LV adjustments on page 34 in the TS-530S service manual? It's possible that VR2 and VR3 on the AF Unit board are dirty and need cleaning? Clean VR2 and VR3, with power turned OFF, then perform 3.2VDC and 9VDC adjustments in step "1" on page 34 in the service manual.

Kenwood TS-820 and VFO-820

I have a TS-820 and VFO-820 from a silent key estate.

Unfortunately, somewhere along the line, they "lost" the cable that connects the two.

I can probably make a cable if I can get the info on what to connect to what. In other words, I need the information as to what wires go to what pins of the 9 pin connectors. Does anyone have this info, or know where I can find it?

Thanks.

Topic: 54190 Message: 54192

Hi Kevin,

Thanks for that info. It looks like I need to clarify the info I need.

While the TS-820 manual does list the info for the pin outs of the 9 pin socket at the TS-820 end, that does not say what all needs to be connected. E.g. there is 12.6 V AC at the TS-820 end. Since there are no tubes in the VFO-820, does anything need to be connected to that voltage? What about "relay voltage" and "calibrator signal"?

I have no info on what the VFO-820 requires, so I do not know what to connect. That is what I need.

Thanks.

73,

Ken, W8EK

Hi Ken,

You can also do a google search for vfo-220 cable and you will find step by step instructions on building the cable. There is also a guy making and selling them at a reasonable price.

Hope this Helps,
Kevin - N2FLP

Ken and others,

The VFO 820 cable connects pin to pin. This means pin 1 on one plug connects to pin 1 on the other plug.

The VFO-820 cable can be use with 2 TS-820 series transceivers AND the TS-520 series transceivers, no changes required, plug and play.

The VFO-520 can also be used, plug and play, with the TS-520 series transceivers AND the TS-820 series transceivers, plug and play, no wiring changes.

Kevin,

There isn't a Kenwood VFO-220. There's a Kenwood VFO-230 but that VFO
will not work with the TS-520 or TS-820 series transceivers.

Hi Mike,

I meant to say VFO-820. I actually had it correct and then changed it to vfo-220 due to a brain blackout.

Hi Kevin,

Okay, understandable typing mistake.

Some hams question whether the VFO-230 or VFO-240 will work with the TS-520 or TS-820 transceivers; Neither of those VFOs will work with the 520 or 820. Why? Because the connections are different and the VFO tuning range is different. The 520 and 820 internal VFOs operate over a frequency range of 5.5Mh (bottom of ALL bands) to 5.0Mhz (top of ALL bands). The VFO frequency range, either internal or external VFO, does NOT change, something that many hams today do not understand.

The relay in the VFO-520 and VFO-820 can cause problems, especially when setting the VFO520 or VFO820 FUNCTION switch to control RX and the TS-520S internal VFO to control TX. When this happens simply pull the relay from the VFO520 or VFO820, remove the outer cover (gently) and clean the relay contacts, ALL of them.This fixes the problems. I experienced this problem with a VFO820 and the fix was to clean the relay.

Another problem is broken or poorly soldered connections at either VFO connecting cable plug. If the cable is suspected, simply use an ohm meter to check continuity between pins 1 thru 9. As I said before, the VFO connecting cable wiring is "pin to pin" which means pin 1 on one end connects to pin 1 on the other end, pin 2 to pin 2, pin 3 to pin 3, and so on. Every pin on the VFO connecting cable is used, requiring 9 wires to be connected.

Something some hams don't realize is, the VFO inside the VFO-520 or VFO-820 is the same VFO inside the TS-520 and TS-820. The 2 VFOs, whether internal or external, are "analog" VFOs so there will be some drift. Just because there is a digital display does not mean the VFO is digital.

The internal and external VFOs are powered by "9VDC" which means if you remove the VFO from the transceiver or VFO cabinet for cleaning/maintenance you can power the VFO for testing from a 9VDC source. I use a regulated 9VDC supply to power the 520, 820, and 120 VFOs. A 9 volt battery can be used in a pinch. You can connect a frequency counter to the VFO's RCA output socket to check the VFO's tuning frequency. If the frequency counter displays unstable tuning on the frequency counter, more then likely the VFO variable capacitor's shaft to frame and bearing connections are dirty and need cleaning (grease also replaced). I'll have a video on my web site showing this type of VFO output frequency instability as seen on a frequency counter and the fix to eliminate this problem.

54202. TS-820S: COUNTER FREQUENCY CALIBRATION

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-03 17:41:58 UTC
From: n1psx@...
Topic: 54202 Message: 54202

I am seeing a .3 deviation from the actual frequency on the frequency display of the TS-820S... Below I have pasted in the calibration process as described in the manual... Question: does anyone have such a cable for sale, or if not, how does one construct this cable...? What connectors are needed, type of cable, etc.

COUNTER FREQUENCY CALIBRATION

With the FUNCTION switch in the VFO position. turn the BAND switch to receive 15 MHz WWV standard signal. By connecting the counter calibration cable suppled to the counter unit and the X VERTER IN jack on the rear panel. the WWV beat signal is superposed on the higher harmonics of the standard signal of the counter and is heard as a double beat signal. Adjust the trimmer of the counter unit to obtain a zero beat. By so doing, the frequency indicated on the di- gital display is accurately calibrated. After the calibration. disconnect the counter calibration cable.

Thabnks in advance

You can make a usable cable using inexpensive audio cable found in DVD/DVR/VCR. Cut one RCA plug off from one end of the cable, leaving the other RCA plug on the other end of the cable.
Strip off the insulation from the cut end, exposing the shield and center conductor.
Remove the insulation from the center conductor and connect the center conductor to a mini grabber clip.
Connect another mini grabber clip to the cable's shield, you home made usable cable is DONE!!!
Mini grabber clips come in a variety of colors so use a RED for the center conductor and BLACK for the shield.

Don't know what a mini grabber clip is, the picture below shows what a mini grabber clip looks like.

You dont need the cable.

Zero beating WWV is old fashioned way to adjust a crystal calibrator. In old days WWV and CHU were about the only games in town. Propagation, doppler shift, good ear etc all come into play.

Today there are lots of accurate reference signals available. With all the high dollar DSP rigs on the air that have very accurate output frequency you can go to a net such as Maritime Mobile 14.300 or ECARS 7.255 and tune VFO for natural voices on the net controller or on strong check in stations and then adjust the the trimmer cap to put your DG-1 display on frequency.

Just let the rig warm up good before adjusting.

Also, If you have an accurate bench Frequency Counter can also adjust the DG-1 clock oscillator. I employ this along with 10mhz rubidium reference oscillator, but for average user the NET method is good enough.

Hello All,
I am quite new to the 820S and also to ham. Please guide me to correct this issue.

I noticed that the max output power in the bands as follows:
80m- 50W
40m- 75W
20m- 40W
15m- 45W
10m- 40W

I use a multiband wire dipole (Homebrew). What could be the issue, and what should be done?

Thanks in advance,

Hi all,

Just picked up a TS830 and have an issue to fix. Radio was sold as complete and in good working order. After receiving the radio, it’s is in good working condition but something didn’t seem right. After investigation, the radio is missing the silver calibration ring on the tuning dial. No way to calibrate the analog dial. Does anyone out there have one or that assembly that they would be willing to sell at a fair price. Radio is in nice shape and would like to get it back to 100% original condition.

Thanks for any help, Wayne KI4UYA

At first glance, it looks like the transceiver is reducing its power across

the board due to an SWR issue, with the best match being the 40 meter band. I would re-check the output into a 50 ohm dummy load before concluding that there is anything wrong with the transceiver.

1. What is your HV reading? Should be at least 900vdc in SSB mode with mic gain turned down. If it is in the 400vdc to 500vdc range you have lost one of the doubler filter caps. Must replace both.
2. How is your RF drive? Can you obtain full scale ALC indication when peaking the Drive control with no excessive Car Level Pot opening? If not, then try another Driver tube as a first step.

3. Finals may be soft. What is the nature of the plate current dip? Broad and shallow vs sharp and deep? Do you have another set to try?

4. What test equipment do you have?

5. Are you comfortable making a visual inspection of the PA cage? Discolored RF Plate choke,discolored Plate block cap, discolored or holes or cracks in the RF Bypass cap, small VHF choke discolored (not common on a TS820).

I forgot to mention if you want to leave both Final tubes in you can add a series dropping resistor in the 210 supply lead to lower the screen grid voltage to the Finals. Start with a 12k ohm to 18k ohm. This is what KW does on the TS820 in the FSK mode position so that plate dissipation isnt exceeded when running RTTY.

Well the plate impedance (RL) will of course be different (2X from approx 2k ohm to 4k ohm) with a single tube, but the Pi network caps and inductor have adequate range to still match the new impedance to 50 ohm load.

The white band marks on the arc around the Tank capacitor may not coincide with two tube resonance points? If not, might have to make a cheat sheet.

Havent done any calcs on Pi-network loaded Q or effect on 2nd harmonic suppression, but since KW offered the 75 watt conversion for Novice class have to assume that they looked at all of that?

Terry K9TW

Thanks again Terry. I have no idea what the fellow wants to do. I’m assuming this may be his idea of lowering the Po so he can drive an amp. But he’s not said specifically.

Subject: Re: [TS-520_820_530_830] Re: 6146 "dummy" replacement - for limiting power to novice levels

Well the plate impedance (RL) will of course be different (2X from approx 2k ohm to 4k ohm) with a single tube, but the Pi network caps and inductor have adequate range to still match the new impedance to 50 ohm load.

The white band marks on the arc around the Tank capacitor may not coincide with two tube resonance points? If not, might have to make a cheat sheet.

Havent done any calcs on Pi-network loaded Q or effect on 2nd harmonic suppression, but since KW offered the 75 watt conversion for Novice class have to assume that they looked at all of that?

Jeff:

On the TS830 very easy to do without removing one of the 6146 finals.

The Final board has a wire wrap post PD-1 with a 15k series resistor that is not terminated. Could easily mount a SPDT switch on rear panel and switch SG lead from the Final board to either PD-2 or PD-1 to feed the Screen grids.

If 15k ohm doesnt lower the screen grid voltage enough increase the value until get the output power level he needs. This way he can retain normal operation when he doesnt want to drive the linear.

Most people just insert a thick film resistor T-pad in the output. These have been discussed here quite a few times.

Jeff,
As terry-k9tw stated, there is indeed the item in question...I have just never seen one in use. If the person that asked you about it just wants to lower power output to drive an amp...there is a simple circuit for such a use contained in the "files" section of this group's home page, that uses the octal socket at the rear of the 520-820 series rigs, and it can also be used on the "din" remote socket on the 530-830 series of rigs. Mike-w5rkl, also has the schematic available at his web site: w5rkl"dot"com

Roger:

Yes that trick was pretty common back in the Class C days. Just plugs right in with no other changes to the radio, but you do have to watch the 2E26 Plate Dissipation. As I recall 2E26 is around 10 watts?

I dont recall ever doing it on with a SSB rig.

I ran a few Johnson rigs (Vikings and Rangers) and they made a nice 6dB T-pad attenuator that would go in the output coax to drive the Thunderbolt. I never owned the Thunderbolt, but did copy the attenuator design. Just lots of resistors in parallel in each leg. Thick film resistors didnt exist then!

Dayton Hamvention Forum:
There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by me, WB0IQK. There were
25 stations checking in under good
conditions. There was 6 new station checking
in, AB2UE, KR8T, N4WJC, K9ZUT, KC9UDJ, W9OCC, and K8DXX.

We had the following number of radios checking in.

4 running TS-520(x)
3 running TS-530(x)
3 running TS-820(x)
3 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830s + Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
10 stations checking in under good
conditions. There was 1 new station checking in, K1GBX.

We had the following number of radios checking in.

4 running TS-520(x)
0 running TS-530(x)
0 running TS-820(x)
2 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
1 running TS-900

He was running his TS-520 + Heathkit SB-200 amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday□s net total = 66, Sunday□s total = 46
December 2015, Saturday□s net total = 55, Sunday□s total = 73
January 2016, Saturday□s net total = 129, Sunday□s total = 81
February 2016, Saturday□s net total = 98, Sunday□s total = 72
March 2016, Saturday□s net total = 25, Sunday□s total = 10 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

73's,
Mark, WB0IQK

Hi Ned;

Yes glad that your rig is back to live ...

I do have also both types of them ….

The silver type,and the bronze one,with also the original external loudspeakers.

Those are great retro rigs to obtain and to work with..

Especially with both,the separate RX ad TX design …..

I like this system setup,I wish they still made sutch setup with modern transceivers also !!!

I always found it is a bad idee to find that older rigs have always poor or not have any sense of sensitivity ??

I do have work all my DX in past,with a great FT101ZD …

Some guys think,sensitivity of a rig depence on the value you pay for it hi …

Regards es 73’s Jean/ON4AEF.

TS-520S

Here is an update

Relay confirmed it is fine

With -72db fed into the unit I cannot hear the signal.

As I was probing around on the RF board touched the pins lined up with the slugs in the bottom of the rig and signal came alive. It was a scope probe not connected. The signal generator was heard and was about S6.

The pins I touched were in a line and had ANT, AVP, R_G, AVE

I am not sure what any of that means but as I touched those the receive improved dramatically.

Any additional thoughts or next steps appreciated

Thanks in advance

Kevin

Attachments: 2 described; binary payloads are missing from this source WARC

Kevin,

You didn't say whether you have the following manuals or not. Therefore, here are links to them plus a link to a high resolution schematic of the TS-520S with both RX and TX voltages at various points. You should not attempt to service your TS-520S without the service manual and a good copy of the schematic.

Operator Manual:
http://w5rkl.com/wp-content/uploads/2014/04/TS-520S-Operators-Manual.pdf

Service Manual:
http://w5rkl.com/wp-content/uploads/2014/04/TS520S_service-manual.pdf

Another nice document to have when troubleshooting problems is a good clear copy of the TS-520S schematic:
http://w5rkl.com/wp-content/uploads/2014/04/TS-520S_LARGE-Schematic_Hi-Res.pdf

/There are voltages in the TS-520S that can KILL YOU if you are not careful and/or you are not paying attention. //Be careful, there are high DC voltages, +250VDC and +300VDC on the RF Unit that are used by the driver tube (12BY7) so don't be poking around with your fingers. Use the schematic and service manual to be sure you are connecting your test equipment to the proper place. Do NOT assume anything, check to be absolutely sure./

Since you have a signal generator, try a simple test on say 40 meters. Use the Xray view of the RF Unit found on page 18 in the TS-520S service manual to locate the "ANT" terminal between T6 and T7. This terminal is not labeled on the schematic. There are actually 2 "ANT" terminals on the RF Unit as seen on the Xray view but only "1" is labeled on the schematic!

The picture below is a section of the RF Unit I cut and pasted from the high resolution schematic (see the link above) that shows the "ANT" connection between T6 and T7. You will find that terminal on the Xray view, page 18, in the service manual. This terminal is NOT labeled on the schematic as shown in the following picture.

The picture below shows the other "ANT" terminal that "IS" shown on the schematic. If you look on the Xray view, page 18 in the service manual, you will find it next to "JAS" terminal. If you find "VC2" on the Xray view, look to the directly above VC2 you will find Q2 then JAS and next to JAS you will find "ANT" which is shown in the picture below. That is the second "ANT" connection on the RF Unit.

Set Mode switch to USB or LSB, it doesn't matter as you are only concerned about whether you can hear the generator's signal or not

Set the band switch to "7"

Set the VFO to zero

Adjust the DRIVER for a peak noise heard in the speaker

Tune your signal generator to 7Mhz

Set the signal generator output to approximate less than 1uv

Connect the signal generator to the RF Unit's "ANT" terminal between T6 and T7

You may have to adjust the VFO and/or the signal generator to find the signal.

Do you see the signal (S meter rises above zero) and hear a beat note when adjusting the VFO knob either direction? The S meter should rise rather high. If the S meter pegs fully to the right, lower the signal generator's output so the S meter is around S5 or S6 then adjust the DRIVE control, the S meter should increase.

I usually start with my signal generator set to it's lowest possible setting then slowly increase the output until I hear the signal then stop increasing the generator's output. I do this as my generator's do not have calibrated output indicators. A scope in parallel with the generator's output could be used as an output signal level indicator. I use BNC "T" connectors for this sort of monitoring of a signal generator's output signal level.

I could be wrong but from what you said, it appears there's an intermittent connection at one of the terminals you poked around with.

Kevin: I assume the pins you are talking about are on the coil boards. The ones with the connecting wire wrapped around them. If this is the case, I have had difficulty with the solder connection between the connect pins and the board. They may need to be cleaned and resoldered.

Mike

Thank you very much and very much aware of voltages and take tremendous caution in working on any gear. I do appreciate the additional points of caution being raised.

I will reread your input in detail and thank you in advance.

Kevin

Mike following up on your suggestion.

I inserted the signal on the pin marked ANT between T6 and T7.

I am seeing and hearing the signal perfect. S8 to S9 level.

Mike,

Thanks for the links for the manuals. I had some but could barely read them.

Came straight home and applied signal to the ANT pin located between T6 and T7.

S8 to S9 signal and sounded perfect

Thanks

Kevin

TS-520S up day. Thanks so much for the help. The rig has been repaired. The issue was someone had the center of the coax and ground that went to the Attenuator on the same pin on the switch thereby taking the signal straight to ground.

Wired correctly and the rig is playing great. Special thanks to Mike for the the tip on where to insert signal and the wonderful schematics.

Thanks again

Kevin

54245. "for sale" poll

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-09 04:36:56 UTC
From: Joseph Stiles
Topic: 54245 Message: 54245

Greetings group,
The poll regarding a possible update to the "for sale" rules is now closed.The poll asked:

should items advertised as "FOR SALE" to the group, be limited to Kenwood hybrid rigs and/or parts?
Drum roll...pse: YES - 97 votes or 80% NO - 11 votes or 9% Don't care - 14 votes or 11%
The group rules/policy regarding "for sale" items will be changed shortly, and a msg will go out to all group members reflecting the new rules/policy change. The rules will also be available for viewing in the "files" section of the group home page as usual

Greetings group,
  Another house cleaning item:
    It is still amazing how many post/msgs I have had to reject recently. Again, the main problem seems to be not reading the group rules/policies regarding proper signing of your post(s)/msg(s). Every member upon being accepted into the group, gets a electronic copy of the group rules/policies automatically sent to them. You can set up your yahoo email account, or pretty much any other for that matter, to automatically add the proper signature at the end of your post(s)/msg(s).
  So, if you are a new member,and/or moderated, AND yours posts have NOT been showing up, that's the reason. 73

John,
The requirement of signing your post(s)/msgs IS a requirement for ALL group members, and it's clearly stated. Whether you think it's bizarre, is not a factor. There are many, many groups that require a signature, and even if they do not, let's just say it's a common courtesy to identify yourself. The FCC requires that you identify yourself by using your call sign, or is that also bizarre, and not needed? All new members, and others who can't follow the rules...their posts are "moderated." If an "un-moderated" member continually fails to follow the simple rules/policy, one warning will be sent to them. If it continues, the offending member will be put back on "moderation." The rules of the group are not secret, nor are they ambiguous, people just don't take the time to read them. This has been a problem for quite sometime, not just recently. Really, how hard is it to (at a minimum) put your name at the end of your post(2 seconds), or set up your email program to do it for you(1-2 minutes)? If, following the groups rules/policy is too much of a burden, you can always "opt out" of the group.

If there are any further comments, direct them to me "off list."

54250. TS-830S keeps sending when going off PTT - RL-1 problem?

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-09 18:03:56 UTC
From: Martin Jangowski
Topic: 54250 Message: 54250

My TS-830 starts to hang in TX when going off PTT. I can still see modulation on the SM-220, and the Bird 43 shows output power. When pressing the PTT a few times, it will eventually go back to RX.

This is not a PTT key problem, it happens if I use the PTT key on the microphone or the foot switch (connected to the AUX plug) or the SEND/REC switch on the front. Could this be a problem with a aging RL-1 relay?

Hello!
I have a 530SP that I need to get working (So it's functional once I pass the test). I am wondering if the group would be willing to entertain a discussion on the most common problems of these units, and the fixes for them?

Mine won't tune, for example. It seems to receive fine. Although I have yet to connect it to a real antenna. Then one I have looks like a short CB antenna (mobile for 10m?). I have heard some kind of distant shortwave radio station, that broadcasts cattle and hog prices, but not actual radio to radio traffic or conversations. We will see when I string up a dipole though.

All the tubes glow. It's a clean unit, with some minor frequency mods., so I think it's probably something simple, and common.

I am also curious as to other common, well known problems that I should look out for.

Whats your experience?

Gian (John)

Darran,
Have you checked the rear panel's "SG" switch to ensure it's in the "ON" position" If it's in the "OFF" position, you will achieve a TUNE mode peak ALC indication when adjusting the DRIVE control but there will be zero final tube cathode current (IP meter indication) in CW and USB/LSB Modes!

John,
I did not see any reference as to you knowledge and skill level nor whether you have the TS-530 user manual or not. The User manual should be the first place you go before attempting to operate a radio you are not familiar with. I have the User manual on my website (see the following link).

The link to the TS-530SP User manual:http://w5rkl.com/wp-content/uploads/2014/04/Kenwood-TS-530SP-manual.pdf

If you do not have the TS-530SP User manual, I highly recommend you download the User manual using the above link and spend time studying the manual before you attempt to operate your TS0-530SP! The user manual covers all the basic operation of the TS-530 transceiver.

Do NOT attempt to use a CB antenna with your TS-530!!!! The TS-530 is NOT designed to operate on the 11 meter CB band. Using such an antenna in transmit can cause damage to your TS-530 transceiver. There are plenty of websites offering inexpensive wire dipole ham antennas.
http://www.dxengineering.com/parts/mfj-1778m?seid=dxese1&gclid=CNK1p-fPtMsCFUk6gQod7NQIxA

http://www.aesham.com/antennas-base-wire/

The following is a link to an ARRL document that discusses what a dipole antenna is. Includes the materials required to build one yourself.

http://www.arrl.org/files/file/Technology/tis/info/pdf/9106023.pdf
The insulators shown in the document can be replaced with simple short lengths of small diameter PVC pipe found at your local hardware store. Insulated hookup wire can be used as wire for each side of the dipole antenna. Simple lamp "zip cord" wire can be used to make a dipole antenna, simply spread the wire apart for each side of the dipole antenna. Zip cord lamp wire can be found at your local hardware store. My 40 meter inverted vee (dipole with ends drooped downward) cost me about $10 and about 2 hours work to build and tune the antenna for a low SWR at the center of the 40 meter band (antenna works fine over the entire 40 meter band without further tuning).

Another book that new hams should read and that is the ARRL book on single side band. All too often new hams have no idea, no clue, how single side band works. They buy a single side band transceiver, connect it to some antenna, plug in the microphone and press the microphone PTT button in USB or LSB and wonder why where's no RF output. The reason is because they never spent time learning the basics of single side band. Cut the ad number from the following listing, paste it into eBay's search text box and click "Search". The eBay ad will come up.
eBay ad#182047316678Price: $9.99 (Buy Now)Shipping: $4.00
This book will provide the new inexperienced ham, even older experienced hams who want to refresh his/her knowledge level, with the necessary theory behind how single side band works in both receive and transmit. The book covers both methods of generating single side band, the Phasing and the filter methods.

John,
You have provided get little Ingo on your problem.
We have no understanding of your understanding on these radios or electronics, so a tailored response is difficult.

You say you have rx, this is too broad a statement. Have you used the on board calibration to give an idea of rrcvr?
Do you have a dummy load rate for this radio?m
Is there is any output, have you checked the sg switch on the rear panel?
If you have no experience with this type of radio, it would be a very good idea to read the operators manual, following tune up procedure then see where we go fro there. We can help but need clear and concise information to work out the problem.

Topic: 54252 Message: 54258

OK, fair enough.

I suppose I should start with some background, so everyone knows where I am at skill wise.

I have several basic electronic course from Highschool (30+ years ago), and considered myself a hobbiest/experimenter at the 101 level. I was big into CBs back then, and had a (and still have the same) Cobra 148GTL. I originally had all the major work done to it (including a crazy amount of extra channels put in), but was dismayed when my beautiful radio now sounded like garbage and bled 3 channels up and down and onto the TV as well. The guy who did the work wanted to charge me just as much to un-do his disaster, as he charged me to do it in the first place.

So that took me down a path of study and experimentation that led to returning the radio to stock, and remodifying it so that it retained it's original performance plus some. In the end, it got frequencies into the 10 meter band (then, Novice subband), and was the loudest, clearest sounding radio in the neighborhood...with no TVI or channel bleeding. It was no small learning curve for me.

I discovered though, that the transmitter could not simultaneously perform really well on the CB band, AND the 10 meter (into a 50ohm coffee can style dummy load that I still have today). To get it to work properly on 10 meters, meant realigning the transmitter for that band when I would want to use it, and then doing so again if I wanted to go back and use it on the CB.

I had some guidance from a HAM, who was a friend of a buddy of mine from the neighborhood (Ke9ol, I think). It's crazy, but I can't remember the guy's name, but I remember his call sign. He never stood over me while I worked or anything. He more set me in the right direction by example and offering advice. The first of which was to stop screwing around with the children and thier lame ideas on the 'kiddie band', as he called it. He felt becoming a legit ham was the more sensible way to go...and he was right. Probably the single best advice I ever got. I went to my first hamfest with him and my buddy when he was shopping for his big HF amp. If I had to guess, I was 18 or 19 at the time (48 now)

The plan then was to get my Novice ticket and use the 148gtl on the 10m subband as my first rig. I got a code key with a practice oscillator and started practicing (Code was still required back then)....then life got in the way. The whole hobby got shelved and everything just kind of sat.

I was making dipole antennas and such to try and come up with one that worked on the entire spectrum I had available through the 148 too. I was using it to DX on the SSB off the dipols because they did a nice job where my regular CB antennas did nothing. My best contact was with a guy in Great Britain on LSB within the actual legit CB band. Very cool. I actually did it off a dipole strung up in the trees at my parents house on only 12 watts. It blew me away because I could not get 10 miles on that in AM.

Fast forward to now, and I am having a resurgence of interest in the hobby and want to pick up where I left off. This started with a Baofeng handitalkie I bought on a whim because it

was cheap, and some buddies have them. I quickly found out these were not toys, and actually are entry level 2m/70cm handhelds. I got quite the looks when I told others these were completely illegal to use and required a license....yeah...they think I have 3 heads...how could a flip'n $37 "Walkie Talkie" be illegal to use without a license? Thats crazy talk!

Now, here is what I know about the 530:
I specifically sought this radio out, because it is a hybred, and I just like the old fashioned tube design of the transmitter. Also, it is/was a flagship model of the Kenwood line. A big part of this was influenced by Ke9ol from all those years ago. He was a big Kenwood fan and talked them up quite a bit He was very proud of his TS-450. Frankly, I was originally looking for one of those.

However, I also have a Knight T-50 CW transmitter(works perfectly btw). This was bought at a Hamfest back in the day, tested and never really used after that. I just really, really like old fashioned tube radios. I was originally looking for a vintage of that era, when I discovered that Kenwood made hybreds in the 80's. I became amoured with them and started seeking out a 530 or 830 (mostly because I like the face and style over the 520 and 820s).

As for how to use it, I have been studying youtube tutorials, and I figured out the tuning procedure. There are some good ones. I tried to go through it into the 50ohm coffee can dummy load I have had since the CB days, and found it won't tune.

It had been shipped to me with an antenna, that looks like a short CB antenna (I am thinking it's a 10M mobile) With that hooked up, I was able to hear a few things, like broadcast stations around 1.6mhz. But these seemed really, really distant. There is a big difference in the static with the antenna hooked up, vs not though. I need signal to really test it (oddly I have a vintage signal generator, bought around the same time as the Knight T-50, have no idea how to use it though)

I opened the 530 up, and found the driver tube about out of it's socket. It was shipped to me, badly boxed via UPS. The case got dented in shipping, so I thought that must be the problem. I set it back in and tried again. Same issue.

I also saw that someone added a toggle switch that is wired into the VFO. I was able to figure out that drops it down to 26.500 (or somewhere in that range) when the unit is in the 10m band on the band switch. There is also another mod that makes no sense to me...it looks like someone was trying to connect it to an old fashioned computer maybe? Also some one added a second auxiliary speaker jack to the back. It is the exact same as the factory one, and wired in parallel with it....not sure why someone would do that.

Now, I am pretty green...so green that I literally just described everything I know in a single post...but I do know there is a lot of power in there. So I decided to shelve it and do some research. I need to know how to de-energise the system before I do anything else.

Also, I need schematics, manuals and troubleshooting guides specific to this model, so those links above will be a priceless resource for me THANK YOU!

Anyway, thats the story. I figured I would start with trying to find out all the common, and well known problems these radios are prone too and go from there (Like fixing a car, check the easy stuff first).

Gian

54259. Transmit Question

I'm sorry you don't get it John.

I mean no disrespect toward any member.

If a driver looses his/her drivers license because they drive too fast, constantly exceed the speed limit, then end up in traffic court, do they blame the Judge who suspended their driver's license, blame the Police officer who gave them the speeding tickets, or do they "hopefully" take responsibility for their actions of speeding and "hopefully" drive within the speed limit?

The same applies to this group's policies. Joe and the Moderator's have spent many hours going over messages, both Moderated and non-Moderated, to ensure they ALL adhere to the group's policies. This takes a lot of time. It takes less than 5 seconds to add an acceptable message signature to the end of a member's message. If a member can write a multi line message, some explaining in detail the problem they are having, then they can take the few seconds at the end of their message to ensure their message contains the required and acceptable message signature at the end.

Member have been told how to configure Yahoo to add their signature to the end of their messages.

Members have also been told how to configure email client software such as Thunderbird how to have it add the message signature to their messages.

There is no excuse for any member to not add an acceptable message signature to the end of their message. The "I forgot.." or "I didn't know" or "why do we have to do this, other groups don't have this requirement" excuses no longer hold water. I support the additional actions Joe has taken because members continue to ignore group polices, do not pay attention, or are just too lazy to take 5 seconds to add an acceptable message signature to the end of their messages! Joe has stated many times that any member who feels they cannot follow the group's policies, for what ever reason, the member is free to terminate their membership.

John, it is a requirement on all my groups but one. On that one, I am an owner, but not the boss, so I don’t implement the requirement there. But, on the others, it *IS* a requirement.

As for me, as a user personally, I like to know with whom I am ‘talking’ to!

Greetings group,
The requirement for signing your posts/msgs, and moderation of new members, goes back to the inception of this group...circa 2003-2004. In fact, the requirement(s) have actually been relaxed, most recently in December 2015.
So, If you care to discuss this topic further, feel free to do so "off list" and/or to me directly.
This topic is closed.

Yes, I do of course understand it is a requirement but the way the requirement is applied is a bit silly, I.E., deleting a message or sequestering it for no name - come on.... Just because "that's the way we do it" doesn't necessarily mean it is a useful policy. Having a name or no name at the bottom makes zero difference in a useful information exchange.

I find this group very painful to use because of moderation of every post (really?) and then the name thing. A new user (once they get approved) should be monitored for a while and then turn it loose. If a problem comes up, deal with it. I've been moderating large forums (membership in the thousands) for several years so I know of what I speak.

73, John

I find your comments interesting, because what you state SHOULD happen, actually does. When a problem comes up....I deal with it. You sir, seem to have a problem with that. If you read the information that is presented to the prospective member, and if/when that prospective member is accepted, it says that: all new members are moderated...which means..just to make it clear to YOU..that EACH post/msg presented, must be reviewed by a moderator/co-owner prior to being either approved or rejected. How long a member is "moderated" is dependent on the member. If they can play by the group rules/policy, participate in group discussion(s) on a regular basis, the moderation time is short(no set time frame), OR on the other hand, continually complaining about the rules, why should I/he/she abide by them, because they/you/he/she think the rules do not apply, or how the group should be run, how the other groups I/he/she belong to don't do it....on and on...moderation will be lengthy. As I stated prior, if an un-moderated member wants to violate the group rules/policy on a continual basis, said member will be put back on moderation. You sir, seem to have a problem with the way group is administered. The rules/policy were sent to you upon your acceptance to this group, and you agreed to abide by said rules/policy. Since you seem to think that the group rules are painful, please feel free to "opt out." Oh, and by the way, this group has over 3(three) thousand registered members, and you seem to be just one of 4 that seem to have a problem with going by the rules.

Gee whiz, Peter

It takes 2 seconds to put a signature on a posting. If you do not remind the fellow he will keep leaving it off.

I agree with the moderators. Just take the 2 seconds and follow the rules.

I think this thread should end now. Let's stick to the rules, hey are there for a purpose.

I just ordered the the ARRL book on single side band. Do you know of any good technical manuals to help with diagnostics and repair? I am looking for something more than the instruction manual it came with. I would like to find a factory service manual for it, and also any sort of after-market technical manuals that would cover troubleshooting and repair. A manual on all the various modifications commonly done to these would also be important. I think returning it to stock is a high priority so I can make sure everything is running like it is supposed to.

THANKS!!

Gian

John,

Please consider the wealth of knowledge that is freely given, and the civility of this forum. It only comes with rules that are enforced. I know every post I have made and probably ever will make will be moderated. And I don’t have an issue with that, it is the price to be part of group which provides me with a good deal of knowledge of these hybrids.

Actually we should give a hearty thanks to the moderators. They bend over backwards to make sure appropriate posts are approved in a timely fashion. They spend a lot of time making sure this list functions well not only from having a civilized discourse but also limiting off topic messages, over quoting and a myriad of distractions. It’s a lot more effort on their part to do this than turning everyone loose.

73,
Joe N9JR

To continue my research here (I hope the group does not mind all this), below is the original E-bay link to my 530SP. It shows the antenna, and also has a good picture of the back panel. I would like to draw attention to the area on the right. There seems to be some sort of old fashioned computer port there. Is that stock? What is is for?

Right next to it is a toggle switch added by a previous owner to jump the VFO down to 26.500MZH, and a second external speaker jack. It is wired in parallel with the factory one, and appears to be the same exact one. Does anyone care to speculate on the purpose of this duplication? It seems kind of weird to me that someone would drill a hole in the back of the unit, only to install the exact same jack that is already there, and connect them in parallel with each other.

I cannot find any sort of model number or information on the antenna, to tell if it is a 10m Mobile, or a CB. Does anyone have an idea how to figure that out?

http://www.ebay.com/itm/Kenwood-TS-530SP-HF-Transceiver-/141917208087?_trksid=p2047675.l2557&ssPageName=STRK%3AMEBIDX%3AIT&nma=true&si=ZxxHpEWPhttWbgfw3wxz3PFNQ5I%253D&orig_cvip=true&rt=nc http://www.ebay.com/itm/Kenwood-TS-530SP-HF-Transceiver-/141917208087?_trksid=p2047675.l2557&ssPageName=STRK%3AMEBIDX%3AIT&nma=true&si=ZxxHpEWPhttWbgfw3wxz3PFNQ5I%253D&orig_cvip=true&rt=nc

As for current progress, I have located and ordered factory service manuals for it, and also downloaded the previously posted PDFs.

Thanks for all your help!! It is much appreciated, as is your patience with my learning curve!

Setting the SG switch to "ON" which is the normal operating position, the 6146 screen voltage on pin 3 of either 6146, will be positive.

Setting the SG switch to "OFF" which is the switch position when neutralizing the final amplifier and in some cases when performing test.

If, in TUNE mode, the transmitter keyed, the meter switch set to ALC, and you adjust the DRIVE control and you see a peak ALC meter indication yet the IP meter rests at zero, check the 6146 screen resistors, R7 and R8, both are 100 ohm 1/2 watt.

A failure in the 6146 screen resistors will have a significant effect on plate current, it will be zero. The reason is the 6146 screens present a negative potential in respects to the plate causing electrons to be repelled back towards the cathode, none of them reaching the plate, hence no IP current flowing in the tube.

Gian,

That is for the 11 meter freq change.

You are asking for help but you have not answered emails sent to you directly.
These radios have high voltage that exceed 900 volts. As previously cautioned if you have no HV experience, you need to heed good advice and caution about poking around inside these radios or you will become silent key very quickly
People give there knowledge and skills freely, if you don't want that help you need to advise either way or the help will dry up very quickly.

Good luck with your radio and welcome to Kenwood hybrid group

Gian,

I had to unwind CB mods in an otherwise nice 530S that were of a similar nature, but not quite this elaborate (a switch inserted in the ABCD switching logic of connector 2 in the PLL unit). My suggestion would be to also look for evidence of "hot rodding" the final amplifier that I also found. Specifically, R11 (470 ohm) was cut on the rectifier board and the 210A supply was jumpered over to the 300B supply to raise the screen voltages on the finals. The 6146B's were shot and had to be replaced, but everything else (including the plate choke) was undamaged.

Good luck!

From: John Davidson
Topic: 54259 Message: 54279

On the TS520 the control labled "DRIVE" tunes the tank circuit for the 12BY7 tube and should be peaked and left, until you QSY. The "CAR" control is how I reduced power on CW and that should not hurt the tubes in any way. Mine were good for 30 years.You can not use the "CAR" control for reducing SSB power. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Subject: [TS-520_820_530_830] Transmit Question

  OK, I've properly tuned the transmitter per the operating instructions and have 100 watts indicated output. Is it safe for the finals if I adjust the drive control for a lower output?
73,
Jim K4AXF

Gian should consider downloadiong the standard Kenwood Tech/Service manual that is written for his model of radio , but only if he has the service shop level RF voltmeters and signal generators required for low level signal tracing and a full alignment. The manuals have noted DC and AC/RF signal voltage levels expected thoughout the radio. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Gian,

I have the operator and service manuals for the TS-520, TS-820, TS-530 and TS-830 KW hybrids on my website:

http://w5rkl.com/manuals/

Simple scroll down and click on the appropriate service manual for your model of KW hybrid.

I recommend you spend time studying the "block diagram" and "Circuit Description" section found in the manuals so you learn how each stages works and how the stages work together to make the radio work. For the KW hybrids that have PLL systems, you will need to spend time learning how those PLL systems work which is quite often covered in the hybrid's service manual under the "Circuit Description" section/chapter!!

The answers to the problems you have with your KW hybrid or other ham gear will not always be printed in a manual or reference book. You have to be able to troubleshoot the problem by using appropriate test equipment, and be able to interpret what the troubleshooting results are telling you.

A few reference books I recommend are:

1. Older editions of the ARRL handbook (study the chapters on resistor, capacitor, inductors, and vacuum tube theory)
2. John T. Frey's "Basic Radio Course" (see eBay ad #200692897318 for the book on CD in pdf format)
3. ARRL "Single Side Band for the Radio Amateur"

I have some videos on my website that show how to use Ohms Law to calculate resistance, voltage, current, voltage drops, and power consumption (in watts) in simple series, parallel, and series/parallel circuits.

http://w5rkl.com/videos/

I also have a video that explains how the TS-520 and TS-820 final amplifier IP meter circuit works.

http://w5rkl.com/wp-content/uploads/2014/03/TS520-and-TS-820-Cathode-circuit-calculations.wmv

Whether you choose to spend time studying basic and advance electronics or not, in order to refresh or improve your electronic knowledge, is entirely up to you. You will not learn it or refresh your knowledge over night. It takes time devoted to studying, performing simple experiments.

From: Martin Jangowski
Topic: 54250 Message: 54282

If someone's interested: somebody had already changed the original RL-1
to a set of four reed relay. One of it was hanging sometimes... Replaced
the whole bunch with two Fujitsu NA-12W-K and the problems are gone. I
measured the old relay contacts and found that some have considerable
resistance when closed. Switched the original Philips case screws to
brand new stainless steel torx screws. My TS-830 looks like new ;-)

I'm curious, as the new owner of a very nice TS-530S, (although I have no interest in 11-meters) how this can be used for CB since there seems to be no AM mode? Are they just using it for SSB CB?

Thanks,
Shane KG5RJS

Gian,
I had to unwind CB mods in an otherwise nice 530S that were of a similar nature, but not quite this elaborate (a switch inserted in the ABCD switching logic of connector 2 in the PLL unit). My suggestion would be to also look for evidence of “hot rodding” the final amplifier that I also found. Specifically, R11 (470 ohm) was cut on the rectifier board and the 210A supply was jumpered over to the 300B supply to raise the screen voltages on the finals. The 6146B’s were shot and had to be replaced, but everything else (including the plate choke) was undamaged.
Good luck!

I downloaded them, but It looks like I am going to have to shop for test equipment to do this project.

I have an old school Knight signal generator, but i have no idea if it even works. It was an old Hamfest score, and I paid almost nothing for it.

As it looks now though,I think this is some sort of butchered CB mod gone bad. I may be able to reverse it with a little research and probing. I was reading that there are a set of resistors in the finals that often go bad when the finals are over driven. So, once all the manuals get here, I will look at that first. Who knows, it may be a simple fix. If not, I can see that I am in for a significant learning experience and growth opportunity here!

Shane,
Your assumption is correct. By regulation, CB frequencies are, or were supposed to be, crystal controlled, and were initially AM, with a limit of 5 watts INPUT, over the years, SSB became available, then "Free Banding(illegal)," which is what you see with the various mods involving the 820, 530, and 830 series rigs. Also, some other "voltage modifications" are employed also. It seems that squeaking out a totally unnoticeable(on the other end) 10-15 watts at the expense of toasting your rectifier board, finals, and some other associated parts,and maybe the transformer, is some kind of bragging right for the misinformed CB crowd. Unfortunately, I have also seen the above mentioned rigs for sale on Ebay...by licensed hams...If I come across a rig that has the "CB mod," I rip it out, and return it to its original configuration.

For AM, one of the ways they did it was to unbalance the balance modulator on one sideband. It inserts carrier and can be modulated on one sideband with sideband bandwidth. Can produce AM but can kill the rig over time especially if you don't know really what you're doing.

Well, from all the illegal operating practices that we hear on 20 & 40,
I would say the CBers have moved to our bands now, and they don't
need/want to modify our hybrids radios.
I also will un-modify a radio that I found to be CB molested & damaged
from mindless hop-up mods.

Hi group, How many times have we seen posts about reducing power on a Kenwood Hybrid radio . Using the mc gain just DOESN'T WORK WELL, there still can be voice peaks to 100 W now and then unless you strap the ALC voltage with a variable voltage source usually a 9 volt battery with a current limiting resistor and a variable voltage divider like a potentiometer. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

I guess I got lucky, I got my TS-820s from a guy I talked to on 10 meters. I paid $200 for it but the shipping was a killer. I sent him $55 for shipping and the cost was $102.00. WOW.
But the good part was it's all stock and the only problem is the digital readout at 28 meg says 20.0 meg.
It's on 28 meg but shows 20.. No big deal.

John,
A simple answer to your question is: lots!
  Many new, or even long time members, do not take advantageof the "conversations" or "files" area of the group's home page.https://groups.yahoo.com/neo/groups/TS-520_820_530_830/conversations/messages
In the area above the real nice Kenwood station, there is an area that you can enter search criteria, and see the prior "conversations" regarding the topic you entered. A word of warning, if you enter a general topic, like say, "low power output," you are going to get a pot full of info. You can try and be more specific, or take a look at the files section...lots of great info there from member contributions over the years.

As I read & often re-read some of these posts, I often wonder why some of these awesome posts are not shown in the files section as standard answers that are not covered in the manual. Even the various links mentioned should be there. Now I am tempted to copy & past some responses or links in the files section, but I am reluctant to post anything there unless I am the originator or owner of the link.

Questions like reduced power could be posted there & when the question is asked, we could just direct them there. I do not have good luck searching conversations sometimes. Keywords are critical and I must be picking the wrong ones.

I see the experts answer the same stuff over & over again & wonder why they don't just insert the answer in the files section. Again, I would only do that if I was given permission. 73 Bob W8RMV

UPDATE:
So, I was able to get it to tune on 11 meters, right? but not on anything else. Well, now it tunes on everything. Weird ehy?

I decided to hook the antenna up again so I can listen. When I put it in, there was the expected jump in static. However, ONLY when the signal was connected. When I started to screw on the outer ring of the plug (ground ring) it all stopped.

I backed it off, and found that it receives much stronger without the ground ring of the coax connector screwed on. On closer inspection I found that the connector on the chassis is loose, and does not seem to have the proper nut. The one that is there is kind of cross threaded, or deformed. It may not even be the right thread to begin with. It won't fully tighten down to hold the connector to the chassis. I am thinking a defective connector may be part of the inconsistent tuning problem.

One other thing I see, is that sometimes the meter is moving, as if it is being modulated, but all I hear is static. Now, I know it receives. I am listening so a pretty strong signal between two Spanish speakers on 7.4050 right now. So, that has me wondering why the meter is sometimes moving like that, when I do not hear a voice or CW along with it? is that just normal background noise that does that?

Anyway, first step is to replace the antenna/coax connector on the radio. I suspect that will make a huge difference.

Gian

Hello all, I am having trouble with my rig. I was using an endfed antenna in my room and was trying to tune it up and I guess (I was told) that RF git into the rig. the thing is then there was a loud growling as I was tuning it up and then I did blow a fuse and something else did go. I did smell a slight odor of smoke. Now I do have lights in the rig and I do hear some white noise but I do not have the digi desplay of I do not hear any tone from the 25 kHz tone. I don't hear any other stuff from the rig ether. Can any one tell me what happened?

Greetings group,
As I stated prior, a significant majority voted for a change/update of the grouprules/policy regarding the above topic. The rules as previously written by Walt-n9wb(original group co-owner), required very little change and should have minimal impact. If I did it right(debatable), a group wide notification/email should be going out shortly 73

54299. TS-830 VFO readout problem

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-13 20:04:27 UTC
From: Kevin Gray
Topic: 54299 Message: 54299

Have a TS-830. Was working great. Removed the VFO to really clean the face.

Cleaned everything. Put it back together.

Problem. The exact frequency shows up when I first turn it on but the frequency readout won't change when I turn the VFO or change bands.

It seems like I must have pulled a wire or something.

Again when first turn rig on the readout is right on. Then moving VFO the freq readout doesn't change.

The radio is properly changing bands and tuning just fine. It is the readout.

Any help appreciated.

Thanks

Do you have a 50 ohm dummy load? If so use it when tuning your transmitter to see if the symptoms change.

Kevin,
Check to see if you have the "DH"(display hold switch) pushed in. It's to the left of the digital frequency readout

54302. TS-830s low power out - high Ip

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-13 22:52:03 UTC
From: Jeff AC0C
Topic: 54302 Message: 54302

I’ve got an 830 on the bench now that looks pretty good except for a persistent low power / high plate current condition.

Put in a new set of tubes (driver + 2x 6146) but no joy. It runs about 40-50w out on all bands max, but the plate current is way too high – about 350 mA. If I restrain the drive with the CAR level to 225 mA, its only about 15w out.

There’s no visual damage and B+ is about 950V idle from the front panel meter; a bit over 800V key-down.

Given the level of gunk buildup on the AF control, the radio must have seen a lot of hours of use. Before I jump further into the back end I wanted to ask if this set of symptoms suggested a particular common fault.

The RX sounds magnificent!

Did you measure the cathode resistors to confirm close to 5 ohms?

If they have drifted high in value the plate current will indicate false high due to the higher IR drop across them. Carbon composition resistors typically drift high which in this application is a conservative failure by displaying plate current indication that is much higher than actual current.

Plate current is measured by using a ua meter movement and a series multiplier resistor to form a voltmeter.

Another clue would be if the HV meter displays a higher level of voltage than normal for 225ma or 350ma. Should be less than 800vdc displayed if that is the actual load on the doubler.

54305. HYBRID NET UPDATE (March 13, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-14 02:43:26 UTC
From: Mark Gilger
Topic: 54305 Message: 54305

Dayton Hamvention Forum:

There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm
The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by Jimmy, WB2KNR.Â There
were 19 stations checking in under good
conditions.Â Â There was 2 new station checking in, Â KK4UOE, andÂ W0HUR.

We had the following number of radios checking in.

5 running TS-520(x)

0 running TS-530(x)

3 running TS-820(x)

1 running TS-830S

0 running TS-510

0 running TS-511

1 running 599 twins

0 running TS-900Â

He was running his TS-520 & SB200.

The Sunday net was run by me, WB0IQK.Â There
were 11 stations checking in under good
conditions. Â Â There was 1 new station checking in, Â KE0CTY.

We had the following number of radios checking in.

5 running TS-520(x)

1 Â running TS-530(x)

0 running TS-820(x)

0 running TS-830S

0 running TS-510

0 running TS-511

0 running 599 twins

0 running TS-900Â

He was running his TS-520 + Heathkit SB-200 amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940â□□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012Â Saturday total 754
check-ins, Sunday tootal 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins

Nov. 2014 □ Oct 2015 Saturdays total 962 cheeck-ins, Sunday total 669 check-ins

November 2015, Saturdayâ□□s net total = 66, Sundayâ□□s total = 46

December 2015, Saturdayâ□□s net total = 55, Sundayâ□□s total = 73

January 2016, Saturdayâ□□s net total = 129, Sundayâ□□s total = 83

February 2016, Saturdayâ□□s net total = 98, Sundayâ□□s total = 72

March 2016, Saturdayâ□□s net total = 25, Sundayâ□□s total = 21(Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:

Good catch Terry. They were pretty high.

One other oddity – R10 is listed as 4.7K on my schematic but the part is a 6.8K. Not sure if that's critical or not. But should it be 6.8K or 4.7K?

Jeff:

Go to my website k9tw.com and read Why R10.

Depending on what production run you have R10 will be one of three different values. R10 does not effect the accuracy of the Ip reading. Depending on value maybe a half a needle widths difference in deflection.

It was KW design engineers attempt to protect the panel meter during final tube arc over events by preventing an "open cathode" condition allowing the cathode to rise toward Screen grid potential. R10 keeps the cathode strapped to ground.

Old timers who ran cathode keyed CW transmitters know how hot their J38 keys would get!

Radio will operate fine without R10, but absent a diode protection string across the cathode resistors I would leave it in. During arc over event the cathode resistors will leave, but I have never seen an open R10.

Hello to the Group,

I have started looking at the possibility of using an SDR setup with my TS-530S. I have been reading some of the posts and and have seen mention of the Soft Rock and RTL SDR's. My questions are:

1. What brands-Types might work best with the TS-530S and why.
2. Is anyone successfully using an SDR setup on 530S to work split etc.

One of the driving factors is both the scarcity and high prices of the remote VFO's.

Any and all suggestions are welcome.

You need a wide band (no roofing filter) first IF. The TS830 has one, the shape of the filter you can tune with the "DRIVE" knob is just visible. There are interesting informations in the SM220 (band scope) manual. It needs the same IF frequency, so there are instructions how to get one from the different models of the Kenwood hybrids. The SM220 manual is available in the web.

I have a TS830 and a "SDRPlay" sdr radio and use HDSDR as software receiver. Just take a piece of RG58 with a RCA and a BNC plug and connect the SDRPlay with the IF1 output of the Kenwood. Tune the SDRPlay to the frequency of the first IF (8.83Mhz with the 830, other models may have different frequencies) and you see the station your'e just receiving at this frequency. This is the first IF, so everything is reversed: USB is LSB and vice versa. With HDSDR you can mirror the frequencies to resolve this.

You can see the usage of the SDRPlay/HDSDR as a pan adapter on my QRZ.com page. Feel free to ask more questions.

I never thought about working split frequency using the SDR panadapter.
Yes, it can be done.
I presented a lecture on how to use the Softrock SDR with the Kenwoods.
The 530 doesn't have a cable installed to bring out the IF signal, but
it's easy to install. I installed one in my 530 (and as well as my
R599A, 900, 820, and Tempo 2020s & Yaesu FT 901/902s).

  Hello to the Group,

I have started looking at the possibility of using an SDR setup with my TS-530S. I have been reading some of the posts and and have seen mention of the Soft Rock and RTL SDR's. My questions are:

1. What brands-Types might work best with the TS-530S and why.
2. Is anyone successfully using an SDR setup on 530S to work split etc.

One of the driving factors is both the scarcity and high prices of the remote VFO's.

Any and all suggestions are welcome.

From: k7mks@...
Topic: 54322 Message: 54322

Working on a friends TS-820(s) I noticed that the ALC meter reading, from 7 Mc and up, has a slightly jittering (oscillating) needle movement. Ip plate reading was steady at all times as is measured RF output. I still need to neutralize 10m, 15 is pretty close.

Would appreciate comments if you have experienced the jittery meter needle.

Dave;

Sorry to take so long to reply.

I checked the supply voltages (3.3v, 9, 15) all are within .2%.
The voltage on the (new) Q4 at within tolerance. The voltages on Q5 are
low by about 20%.
Of some interest is that the tab on Q1 does not align with the locator
printed on the PWB
I guess I will change Q5 next!

Thanks for your interest. Very few replies on this problem

54324. TS-830s tripping SEND mode when moving CW-W and CW-N positions

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-16 05:36:17 UTC
From: Jeff AC0C
Topic: 54324 Message: 54324

Got the TS830s on the desk today, moving my beloved TS-820s out of the way. Worked very good except for an odd observation.

When flipping between CW-W and CW-N positions, it would sometimes trigger a quick jump to TX mode and immediately return to RX. It does not happen all the time.

Any ideas?

Hi Jan,

Yes, I did indeed read the PDF of your presentation at Dayton which was another reason I posted my questions to the group. As you mentioned, the TS530S does not have the IF out like the 830.

The SM220 manual does not list the 530S connection but I recently read an article on N6WK's site about locating an IF pick-off point on the 530S to feed the SM-220,
http://www.n6wk.com/kenwood/SM220-BS-8-with-TS530S.pdf
http://www.n6wk.com/kenwood/SM220-BS-8-with-TS530S.pdf.

Does this look like the best location to tap the IF for the Pan adapter?

It mentions that the SM-220 with the 530S will require a small LPA to register proper levels on the SM-220.

However, I am wondering if the LPA is even necessary with a decent SDR.

If you have any details of what you did with your 530 using the SDR setup it would be greatly appreciated.

You mention the Softrock in your article and Martin is using the SDRPlay.

Is there a particular reason you both chose your respective models?

Thanks to all for the info and support.

1. the TS530S does not have the IF out like the 830
1. Yes it does, they didn't install a piece of RG174 from the IF board to the rear RCA jack. I think there's a hole punched for the RCA jack in the 530 rear panel. Look at how the 830 IF tap is done on it's IF board & RCA jack, the 530 is much of the same. The PCB board has the holes in the board, so you just solder in the coax to the IF board & the RCA jack. Its easy to do.
2. SM-220 with the 530S will require a small LPA to register proper levels on the SM-220.
1. What is a LPA? You might need some attenuation of the IF signal for the Softrock SDR. I made a point of that in my charts.
3. You mention the Softrock in your article and Martin is using the SDRPlay.
1. I think the Softrock Ensemble II is the best for the money because it's _local oscillator is variable_, so you can move the listening window anywhere in the HF band. So, I use it as panadapter for many radios of different IF freq.
4. Is there a particular reason you both chose your respective models?
1. I never heard of the SDRPlay. Maybe that's a UK model. The Softrock is sold here in the States.

I see a lot of you owners just don't get this SDR thing. Think of connecting the SDR antenna coax, to the IF of our radios, and then tuning the SDR's LO to the IF frequency. That's all there is to it....Enjoy your SDR panadapter, I do. I use mine anytime my radio is on.

54330. Kenwood HF Transceiver, and other parts FS

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-16 17:05:57 UTC
From: Ken, W8EK
Topic: 54330 Message: 54330

Kenwood HF Transceiver, Mic Parts, Crystal Filters,
and Cables For Sale:

Kenwood TS-820 S HF Transceiver

The Kenwood TS-820S is designed for SSB and CW modes in
the 160 through 10 meter ham bands. It also features receive
of WWV at 15 MHz. Power input is 200W PEP SSB and 160W
DC CW (nominal 100 W output). This model has a digital readout,
and also can operate from 13 V DC with the appropriate cable
(not included)

As it is, it requires 120 VAC 50/60 Hz 280 watts.
It is 13.3 x 6 x 14 inches and weighs 35.2 lbs.

Features
Digital Readout
160-10 meters
25 kHz Marker
RF Attenuator
NB
RIT
Speech Processor
IF Shift
120 VAC Operation
Capable of 13 V DC Operation

This particular unit works 100%. It is obviously much more
simple to operate than many of the modern rigs. Cosmetically,
it is what one would expect for a rig of this vintage. I only
find one minor scratch, and no dents or dings, but the paint
is not as "crisp" as what it once was. The front panel looks
fine.

With paper work for $275.

Kenwood MC-85 Deluxe Desk Microphone Parts:

The Kenwood MC-85 will take up to three mic cords,
i.e. it is capable of being used on three rigs.

Extra cable to go from MC-85 to a Kenwood 4 pin connector,
as is used on the TS-520, TS-820, TS-120, TS-130, etc. $20

Extra cable to go from MC-85 to Kenwood round 8 pin
connector, such as is used on TS-440, TS-940, etc. $20

Kenwood Crystal Filters:

Kenwood YK-88 S 1 Crystal Filter:
This filter is 2400 Hz wide.
This is a "plug in filter" as opposed to the type that must
be soldered in. It is used in rigs such as the TS-450, TS-570,
TS-690, TS-850, TS-930, TS-940, TS-950, and others.
It is for the 8.83 MHz IF.
It works fine and looks like new.
Paperwork is included for $75.

Kenwood YK-88 SN
This is the "solder in" type filter that is used in the TS-130,
TS-430, TS-440, TS-530, TS-830, R-5000, and many others.
It is 1800 Hz wide making it ideal for narrow SSB, but also
for digital modes. It works fine and looks like new. $70

Linear Amp Switching Cables for Kenwood Rigs:

This cable goes from a Kenwood transceiver to a linear
amplifier to switch the amp from transmit to receive.

One end has a DIN connector, as is used with most Kenwood
rigs. The other end has an RCA phono plug, as used by most
linear amplifiers.

Before using this cable, please check the switching
capabilities of your transceiver, and the requirements
of your amplifier.

Cable for switching the T/R relay. Only $15.

Cable as above, but with ALC line in addition to T/R switching.
$22

Code Key and Cables for code keys and paddles:

Cable for straight key
About 3 feet long, with a mono 1/8 inch (3.5 mm) phone plug on it,
as used with a straight key. $5
As above, but 1/4 inch plug. $5

Cable for paddles
About 3 feet long, with a 1/8 inch (3.5 mm) stereo connector on the
end, as used by most rigs for paddles. $8
As above, but 1/4 inch plug. $8
As above, but 1/4 inch plug and coiled cord. $10

I also have many other accessories of many different brands
available.
Just too many to list here. Please e-mail your requests.

Prices do not include shipping from Florida.

Thanks.

From: Mike W5RKL
Topic: 54324 Message: 54331

That is correct. CW Mode Semi break-in does require VOX to be turned ON.
If VOX is turned OFF in CW mode, closing the CW key or a squeezing a
keyer paddle, will only result in the following:

1. Hear the CW side tone in the speaker as you press the CW key or
squeeze the keyer's paddles
2. The 830 will not switch to transmit

You also need to set the "DELAY" control for the desired DELAY in CW
semi break-in. None of the KW hybrids are designed to operate Full Break-in.

Subject: [TS-520_820_530_830] Kenwood HF Transceiver, and other parts FS

Kenwood HF Transceiver, Mic Parts, Crystal Filters,
and Cables For Sale:

With paper work for $275.

Kenwood Crystal Filters:

Kenwood YK-88 S 1 Crystal Filter:
This filter is 2400 Hz wide.
This is a "plug in filter" as opposed to the type that must
be soldered in. It is used in rigs such as the TS-450, TS-570,
TS-690, TS-850, TS-930, TS-940, TS-950, and others.
It is for the 8.83 MHz IF.
It works fine and looks like new.
Paperwork is included for $75.

Kenwood YK-88 SN
This is the "solder in" type filter that is used in the TS-130,
TS-430, TS-440, TS-530, TS-830, R-5000, and many others.
It is 1800 Hz wide making it ideal for narrow SSB, but also
for digital modes. It works fine and looks like new. $70

Code Key and Cables for code keys and paddles:

Cable for straight key

Thanks.

73,

Ken, W8EK

54333. For Sale Kenwood TS-520 Pittsburgh, PA

I have a TS-520 that is in great condition but has recently exhibited the stereotypical problem of popping the two 10 ohm cathode resistors in the final. Judging from all of the comments I have read on this forum, this ain't the only '520 with this conditon.

I replaced the resistors twice and twice they have popped again in a relatively short period of usage, so clearly there is something else that needs some attention. I have piddled with it for several months and even located two nice new 6146's and but after the resistors blew for the second time I decided that, you know, "this just isn't fun for me anymore!"

The receiver is probably the best receiver that I have ever owned since I first got my ticket in 1961(!). It even has a wonderful (switchable) 500Hz filter that I would have given my eye-teeth for back in the day but without a working transmitter it just isn't work keeping.

Otherwise the rig is in almost pristine condition. I have the manuals and even blew up the schematics so that they are actually readable :-) I feel sure that with a little more patience than I am willing to produce it would make a fine rig for somebody.

I have no desire to sell it except as a face-to-face deal. $200 bucks takes it. You won't regret it.

Almost as soon as I hit "Send" I realized that there are two associated devices that I could include.

I have a relatively new 40 meter dipole with ~90ft of RG-58 and an SWR bridge. I'll throw them in for another $25.

Gentlemen,

I have explained this poorly. Let me try again.

To use semi-break-in, the VOX must be turned on. That works fine. No problems on the CW operation of the rig. This is not about QSK or full break in or anything. The CW operation works just as it should.

However...

The trouble occurs when in RECEIVE. Rotation of the mode switch between CW-W and CW-N will cause the rig to kick into TX just for a fraction of a second...

After playing with it more, that triggering action seems to coincide with the digital VFO frequency display blanking as you reach the midpoint of the rotation between the CW-W and CW-N.

What it feels like is that the VOX circuit is picking up a transit from somewhere in the rig.

That is correct. CW Mode Semi break-in does require VOX to be turned ON. If VOX is turned OFF in CW mode, closing the CW key or a squeezing a keyer paddle, will only result in the following:

1. Hear the CW side tone in the speaker as you press the CW key or squeeze the keyer's paddles
2. The 830 will not switch to transmit

You also need to set the "DELAY" control for the desired DELAY in CW semi break-in. None of the KW hybrids are designed to operate Full Break-in.

54338. Accurate Schematic for 820S

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-17 00:00:30 UTC
From: Dave
Topic: 54338 Message: 54338

Greetings again!

In my ongoing efforts to determine why the "S" meter won't zero after replacing Q4 to resolve a different problem I have come across what appears to be an error in the X48-1150-00 IF PWB schematic:

The gate of Q4 calls for 3.0 (3.25 present) volts yet the schematic shows it to be connected to one of the gates of Q1 which call for ZERO volts!

Comments?

Dave, W5WP

54339. Re: SDR questions and suggestions for TS-530S

Thank you Jan that was exactly the info and feedback I was looking for. Though I haven't had my rig open for a while I do know the location on the IF board and now see it on the schematic. I have the 830 schematic and will go over that too.

Next step is choosing an SDR and getting it configured. I'll keep you posted on the results.

Thanks again to you and Martin for all of the information.

There are numerous mistakes on the KW hybrid schematics and most have been discussed here several times in the past.

You are looking at the AGC bus. These readings taken with a VTVM or DMM with 10 meg to 11 meg input Z will produce voltage levels that will be approx 0.6vdc lower than where you have set RF-1 level (with RF gain pot full CW). Your meter will drive the S-meter upscale as you pull this High Z control bus voltage down just as the AGC detector amp will with off air signal.

Do not assume that your DMM has 10meg input Z on all ranges. Consult your manual. Some of the cheaper meters have as low as 900k Z and will shut the receiver down. Even 2 meg will pretty much kill it. Best meters for AGC work still remain the old HP410B abd 410C that have over 100meg input Z. Absent one of those meters just have to understand how your 11meg VTVM will affect your readings and receiver operation.

Topic: 54338 Message: 54341

Terry;

Thank you for the reply.

The meter I am using is the HP 3456A with an input impedance of 10-10th and does not appear to be loading the AGC buss.

It is beginning to look like a "loop-gain" issue even though the Q4 (an original type replacement) was tested to be within specifications (hfe) using a Tektronix 576 curve tracer.

Q5 has since been replaced with no change in meter or AGC action.

I am beginning to believe this is the problem since all other AGC-ALC functions appear to be more or less normal.

My primary experience has been (other than all solid state gear - primarily ICOM and Land-Mobile) with Hallicrafters and Drake gear with a smattering of B&W and Collins.

I was hoping that someone on the list had encountered this problem.

Regards;

Dave, W5WP

Dave

With that meter on 10vdc range the buss wont know it is there. You are fortunate to have a very nice bench DMM. I use vintage HP-410C that I have refurbed for AGC/ALC buss work.

Not easy to measure the AGC buss resistance to chassis ground due to parallel paths from RF-1, RF gain pot etc. It can be done with some isolation. You can see it is a high Z power supply based on the 2.2 meg feed resistor. Not often have bad/leaky AGC RC time constant capacitors, but it is possible.

On the TS830 approx 5 meg ohm is typical with RFG lifted. I dont have the 820 committed to memory but I think with all the molex connectors landed it is around 350k or so?? I dont have one open here now.

Q4 meter FET very seldom fails and when it does it is more likely to short and peg the S meter. Easy to troubleshoot by paralleling up a low Z 3vdc power supply to the buss like a bench supply or couple of flashlite batteries. If receiver comes alive then know that meter FET is the culprit. I think have seen 2 or 3 in 11 years.

Fortunately, active devices dont fail very often. See handful of relay driver transistors, AVR series pass transistors, and a few dual gate mosfets RF amps that were hurt due to accidental transmit RF.

See quite a few owners replacing a lot of active devices and often using subs and poor soldering even mounting some on foil sides of board due to different packages. I just shake my head.

Terry K9TW

Topic: 54338 Message: 54343

Dave:

Regards standing S meter indication.

I assume that you have set RF-1 (depending on what documentation you are using the spec is listed as 3.3vdc or 3.5vdc).

I also assume then that you have confirmed if the meter circuit is lying to you or not using your HP meter configured for very high input Z. If for example you have set RF-1 for 3.5vdc then with rig on dummy load and RF gain full CW you should see 3.5vdc at Gate of Q4 with your DMM. If you do then the meter circuit is lying by indicating up scale. This is usually due to simply out of cal. If you find lower than 3.5vdc at Gate of Q4 then the meter circuit is seeing that and driving meter indicator up scale as it is designed to do. A reverse reading high Z voltmeter.

I assume that you have tried and are not able to calibrate the meter circuit VR-1 zero and VR-2 span pots for zero deflection with no signal and for S9 with -73dBM at SO-239.

Have you tried measuring the resistance of the two trim pots to make sure correct range? Can set both pots to max R and then measure from base of meter driver transistor Q5 to chassis ground. It will be easier to get ohm meter on the legs of the pot than on base of Q5. Problem with this test is you have some parallel paths like the B-E junction of Q5 that will effect the resistance readings. R23 for example will not measure 15k ohm. Probably about half that value. The best and less confusing test would have been to measure both pots when you had Q4 and Q5 removed. Now I think I would remove the pots and not the active devices again. Probably less likely to lift a pad if you remove the trim pots and measure on the bench and remove R23 and measure it on bench. Q4 and Q5 pads are small and cant take very many heat cycles. True with all of these old phenolic boards.

It would be rare to have a bad VR-1,VR-2,or R23, but certainly could have dirty pots. I clean all carbon trimmers with Deoxit D5 and exercise them and then apply a little Fader lube.

Also, I dont remember if you subed Q4 and Q5 out? If so, that can be a problem. Circuit is fussy as to the FET. A 2SK192A is very often found in the meter FET position instead of the 2SK19.

Both Q4 and, as a desperate <g> measure, Q5 have been replaced with
original types, tested for hfe in a Tektronix 576. Both tested within
range of the listed color group markings for types

AGL seems a bit high at 3.35 volts; AGC at 3.37 volts.

Dave:

Take close look at what you sent.

If you have set RF-1 to 3.5vdc and have rig on dummy load and RF gain at full CW why would you think it would be OK to have 3.35vdc to 3.37vdc on the AGC buss? Anytime buss is lower than RF-1 then meter FET will see it.

RF-1 tolerance is +/- 0.05 vdc. Just get it close and record or remember where you set it so you can verify that is what you have on the AGC buss where the gate of the meter FET is hanging on.

Only time buss should be lower than RF-1 is if you have a signal on the IF that the AGC detector diodes see and biases on the AGC amp and pulls the buss voltage down and drives the S meter up scale. OR Of course if you have backed the RF gain pot down.

Any voltage on the AGC buss below where you set the RF-1 reference voltage will be seen by gate of Q4 and drive the meter upscale. If the AGC buss is lower than RF-1 you will have a standing S-meter indication.

Couple of common ways can have that happen:
1. Actual signal coming down RF and IF chain to the AGC detector diodes
2. Poorly nulled Product Detector back feeding the carrier (CIO) to the IF chain. In this case back feeding thru T7 resonant transformer and the 10pf coupling cap to the AGC buffer amp Q15. It cant tell difference in Carrier Insertion Oscillator back feed and a signal on the IF amp chain.

Suggest you repeat Step 2.6 Carrier Balance. Should get null into range of 1.0 to 2.0mv with VR-3 and TC-5. KW calls it "balance" only because text book product detector (mixer) is doubly balanced which means no IF and no CIO at the output only recovered audio.

Dave:

You can see how Q4 reacts to buss voltage change as follows:
1. Connect very high Z DMM to Gate of Q4. Should see 3.35vdc as you just reported. (should be 3.5vdc as RF-1 is set, but wont worry about that now)
2. Note or record the standing S meter indication.
3. Slowly turn RF gain pot CCW until you see 3.0vdc or a 0.35vdc reduction.
4. Note the new S meter deflection level.

This will give you an idea how sensitive Q4 is to AGC buss voltage changes. My guess is that you would see approx 2 S-unit increase for a 0.3vdc drop in buss voltage.

Best way to cal the S meter is to first perform Coil pack and IFT alignment to maximize receiver gain. Then set S meter zero. Then set the AGC threshold. You do that by injecting 0dB which is -113dBm or 0.50 uv into SO-239 and adjusting IFT T6 until just see S meter begin to deflect. Then inject 40db which is -73dBm or 50.0uv into SO-239 and adjust span pot for S9 indication.

Terry;

Time for couple of fingers of Scotch!

I did reset the voltage at RF-1 to 3.492 volts. Best I can get it. That pot is not easy to get at.

At a .35 vdc reduction there is a more or less 2 "S" unit change.

IFT T6 was properly adjusted. Sig. gen is an H/p 8656B.

S/N test at 14.200 meets the .25uv / 10dB ratio measured with an H/p 400E.

"S" meter STILL won't zero!

No reason to set RF-1 to exactly 3.5vdc. Can be set at 3.3 or 3.4. That isnt the problem.

The problem is that whatever dc control voltage level that you set RF-1 to you will have a standing S meter indication.

You see the reason for the standing S meter indication when you measure the AGC bus and find that it is 0.3vdc or so lower than RF-1. RF-1 is a low Z supply. It feeds the AGC buss thru a 2.2 meg series resistor making the buss a very high impedance power supply. It is not designed to supply current. Only control or servo voltage to Gate 2 of the gain controlled devices.

Again anytime AGC bus voltage is lower than RF-1 it means there is some relatively low resistance from buss to chassis ground. Normal resistance is very high as the only thing that the buss sees is the Gate 2's of the RF and IF Dual Gate Mosfets and the Gate of the Meter FET and these gates are all very high resistances. The only other thing hanging off the bus is the collector of the AGC amp transistor and assuming you have rig on dummy load should be nothing off air for the AGC detector diodes to work on and bias on AGC amp presenting low resistance path from Collector to Emitter loading down the buss.

Again, the buss being fed from RF-1 thru a 2.2 meg resistor makes it a very high impedance power supply that supplies no current to any load. It cant stand any load on it. That is what makes it work.

So where is the resistance (load) coming from? I already gave you some possible sources including:
1. AGC amp Q16 is being biased on by AGC detector diodes. Should only be seeing internal noise and nothing off air.
2. RF gain pot is off full CW position
3. Product Detector carrier is not nulled completely. You mention T6 properly adjusted, but nothing about nulling the product detector carrier like I asked you?
4. Leaky AGC time constant capacitors. I mentioned measuring the buss impedance, but you would then need someone to measure rig that is working properly for comparison.

One other thing you can check is the 2.2meg buss supply resistor. If it has gone very high in value then buss will become very sensitive to any leakage current. Never seen it, but possible.

One other thing you could do if you have a bench supply or couple of fresh flashlite batteries is to temporarily power the buss with a low Z source and see if the standing S meter indication drives back to zero and you can then adjust the zero set point with it applied. If you can then it tells you that the S meter circuit is fine and doing what it is designed to do and there is something pulling the buss voltage down. If you have a bench supply set it to 3.5vdc and apply it to AGC or AGL and watch S meter as you do that. S-meter should drive to zero. If no bench supply then reset RF-1 to 3.2 vdc and use two fresh batteries (new ones are 1.6vdc) in series. If powering buss with low Z power supply causes S meter to drive to zero you know the metering circuit is not your problem.

Lastly, you might want to measure CBE voltages at Q16 AGC amp if leads are accessible. Make sure -6vdc is there as it back biases and sets the detector level. Could also pull Q16, but hate to recommend that without some testing. Never seen one that was leaky.

I didnt see you getting much help so I took time away from bench to try to help. I have exhausted what I can offer.

HI,I have had my meter out today and as you have stated i get no plate current on ip after getting a dip in drive when switched to alc.When switched to alc the needle goes way past the alc box by the way

I have the schematic in front of me and the dc voltages for pin 3 for both valves are there
The voltages for pin 1,4,6 are there -60 and the voltages with the heater switched on for pin 2 are correct

One thing i think i need to mention is that the radio was supplied to me with the sg switch set to off with a much higher bias current present when i switched it back to on which i adjusted to the correct level for tune up.All the above is stated in receive mode,with a dummy load attatched

Many Thanks

Darren,

There is some confusion in your email. You peak the drive in alc, dip the plate in ip and peak the load in rf. You may need to increase the carrier pot more clockwise as the driver tube may be on its way out.

Once you've tuned up properly, got to 28mhz and retune. Go to cw mode with meter switched to Alf. If you see the needle gradually moving towards 0 usually good sign driver tube is on way out. this should only be done for no more than 15 seconds

54355. TS 520SE Contact Cleaning problems

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-19 12:59:52 UTC
From: kk4cwt@...
Topic: 54355 Message: 54355

Has anyone ever cleaned the contacts in the radio and have the radio stop working?

I put mine on it's side cleaned the contacts, let the cleaner evaporate for a few minutes and powered on the rig. It worked. I cut it off, carefully put the covers back on, flipped it right side up and cut it back on to tune it up. The meter pegged all the way left, like it's not getting power and the VFO light didn't cut on. I pushed in the RF button for kicks and giggles to see if that light would come on and it wont. What in the world could've happened to the radio just by putting the covers on and setting it upright?

HI,Sorry about the confusion, sent it in a hurry.Just to clarify i can peak

the drive in alc but when switched to ip i have no current. The needle of
the meter doesn"t move and consequently no rf.The above statements of
voltage measurements are correct plus i have manually checked r7,r8 and the
4resistors r2,r3,r4 r5 in parallel and all are correct.i have also done
simple resistance checks on the finals.Given the correct information would
you still want me to go ahead with the procedure you described

Thanks

Did you follow the switch cleaning process using generous amounts of canned air or air from an air compressor, to remove any residual contact cleaner? I have stated many times on this group and other ham forums to follow every switch, relay contact, and pot cleaning process with the application of generous amounts of canned air or air from an air compressor, to remove any residual cleaner. I have been using that process for years and have never experienced damage to any switch, pot, or relay contact or any other component(s) or PC board. Canned air can be found at Walmart in it's cell phone, TV, and DVD department and also at Harbor Freight stores! I'm sure you can find it else where but I know it's available at Walmart and Harbor Freight as I have purchased from both stores.
In addition to the above recommendation I have also stated that any use of contact cleaner by a technician, the technician should read Warning label on the cleaner's can!! Some cleaners are flammable and it only takes a small spark to ignite the cleaner so adherence to the cleaner's warning label is a must!!

I recommend you go back through your radio and use generous amounts of canned air to remove any residual cleaner that may be left behind after the cleaning process.

The 6146 tube socket pins 1, 4 and 6 are all the same, they have the same DC voltage as the Cathode has, pin 1. Pin1 is the 6146 cathode, pin 4 is the 6146 beam forming element, and pin 6 is the other side of the 6146 cathode. You can see this by studying the Final Unit schematic. Pins 1, 4, and 6 are all connected together at the 6146 tube sockets AND internally in the 6146 itself!!!

Pin 1 voltage is NOT a "negative 60VDC" as stated earlier. The DC voltage on the cathode, pin 1, of the 6146 is either 0VDC (no current flowing in the final tubes) or a positive voltage ranging from +.3VDC (60ma) to +1.75VDC (350ma), assuming the final amplifier cathode resistors have not burnt open and are within the 5 ohm total cathode resistance.

It's quite possible to have grid current flowing in the 6146 tubes (ALC indicated on the ALC meter in TUNE position) but have zero IP current indicated in TUNE mode. This can occur if one of the following occurs:
1. SG switch is set to OFF, applying a "negative" DC voltage to the 6146 screens, blocking the flow of electrons to the plate resulting in the IP meter resting at zero.
2. A failure in the Rectifier Unit's 210A supply voltage path from the Rectifier Unit's 210A terminal, through the HV Unit, the SG switch and ultimately to the Final Unit's "SG" terminal and to pin 3 of the 6146 tube socket.
3. Failure of both 100 ohm 6146 screen resistors, both resistors are open, which results in 0VDC applied to the 6146 screens which results in the exact same symptoms as #1 above!4. One 6146 filament is open causing both filaments to be dark, hence no electron emissions occurring in the final tubes. (both final tubes are wired in "series" with 12VAC from the power transformer applied to pin 2 of the front 6146)

I recommend you check the 6146 screen voltage again. Since you have ALC indicated on the meter in TUNE mode, there's no need to check the cathode resistors since if they were burnt OPEN, you would NOT have any ALC indication regardless of the CAR control setting in TUNE mode!! Remember, the cathode, pin 1, of the 6146s is the "common" return point for ALL currents, grid, screen, and plate, that flow in the 6146 tubes. The 6146 grid voltage, pin 5, in receive should be approximately -95VDC or so, decreasing to approximate -65VDC or so in transmit with 60ma idling current flowing in the final tubes. The cathode voltage, pin 1, with 60ma of idling current flowing in the 6146s (no RF drive) is approximately +.3VDC (300mv) dropping to 0VDC when the 6146 tubes are biased to cut off (receive).

  Darren,

There is some confusion in your email. You peak the drive in alc, dip the plate in ip and peak the load in rf. You may need to increase the carrier pot more clockwise as the driver tube may be on its way out.

Once you've tuned up properly, got to 28mhz and retune. Go to cw mode with meter switched to Alf. If you see the needle gradually moving towards 0 usually good sign driver tube is on way out. this should only be done for no more than 15 seconds

Setting the SG switch to "ON" which is the normal operating position, the 6146 screen voltage on pin 3 of either 6146, will be positive.

Setting the SG switch to "OFF" which is the switch position when neutralizing the final amplifier and in some cases when performing test.

If, in TUNE mode, the transmitter keyed, the meter switch set to ALC, and you adjust the DRIVE control and you see a peak ALC meter indication yet the IP meter rests at zero, check

the 6146 screen resistors, R7 and R8, both are 100 ohm 1/2 watt.

A failure in the 6146 screen resistors will have a significant effect on plate current, it will be zero. The reason is the 6146 screens present a negative potential in respects to the plate causing electrons to be repelled back towards the cathode, none of them reaching the plate, hence no IP current flowing in the tube.

Darren

What I would do is give the sg switch a good clean editing this is done with radio disconnected from power and hv is discharged. Mike, has given good Info report back once you've tried this

Hello
What is the normal voltage on the final tubes?

Thanks

George NE2I

HI,and thanks for replies

I have had some ineresting results tonight,whilst checking through the readings again,sorry guys for the confusion this is what i have

After initial measurements,all in tune mode

pin 3 ....262v

pin 1,4,6 during transmit 0.048v

pin 5........-103v......./during transmit = - 64v

2ND Attempt

All as above but 2.24 on pin 3

Switched off cleaned sg switch,checked function of switch at terminals,switched back on checked and rechecked and 2.24V at pin 3

At this stage i dont know if this is the heart of the issue or i have developed another fault.There certainly was 262v at one point, i will presume nothing at this stage

I also now have the smallest amount of ip needle movement which corresponds to the smallest amount of reading on attatched meter on 20w scale.I havent always had this,it registered zero

Thanks again
73s
Darran

54362. Thanks to the Discussion

Topic: 54362 Message: 54362

The discussion on the lost Ip during tune up was a big help to me. I experienced the same problem yesterday. As I contemplated lost B+ to the driver and other scenarios I read the discussion posted. It talked about the SB switch that cut off the screen bias voltage. I tried working the switch and my transmitter came back ti life. So-thanks to the duiscussion I was spared several hours of trouble shooting.]

Now-if some one can tell me why I have to smack the bottom of my TS820 periodically to bring it back to life I would be pleased. I know, dirty (or corrodeded) connectors is likely to blame. But some one was into my TS820's wiring harness some time ago and probably left me a surprise. I found twisties where there should have been some harness twine.

George,
You can find those voltages listed on the TS-530S service manual schematic.

The TS-530S service manual, with schematic, can be downloaded at the following link:

http://w5rkl.com/wp-content/uploads/2014/04/TS-530S_Service.pdf
The schematic is in 3 pages at the end of the manual.
You will see 2 voltages, one voltage level enclosed in parenthesis which is the approximate voltage in transmit and the voltage level that's not in parenthesis which is the approximate voltage in receive.

The final unit transmit voltages shown in parenthesis are based on approximately 66ma of cathode current (IP meter indication) flowing in the final tubes. Note pin 1 cathode transmit voltage is .33VDC which, when using the following Ohms Law formula, indicates approximately 66ma of transmit idling current flowing in the final tubes:
I = E / R
.33 / 5 = .066
Your TS-520S final unit voltages may not be exactly the same but they should be close.

I forgot to indicate the approximately 6146 plate voltage which is approximately +920VDC in receive, dropping to approximately +875VDC or so in transmit with 66ma of idling current flowing in the final tubes. Again, your 6146 plate voltage may be slightly different.

What is the voltage level at the Rectifier Unit's "210A" and "SG2" terminal in both RX and TX? You could have a problem with the relay "RL1" on the Rectifier Unit.

The positive 6146 screen voltage originates from the Rectifier Unit's "210A" terminal down through the Rectifier Unit's RL1 relay to the Rectifier Unit's SG2 terminal. If the DC voltage is stable at the Rectifier Unit's 210A terminal but not at the Rectifier Unit's SG2 terminal then I would suspect the Rectifier Unit RL1 relay may be causing a problem. In short, trace the 6146 screen voltage from it's source, Rectifier Unit 210A terminal, through Relay RL1, to SG2, through the MODE switch, to Rectifier Unit's "SG1" terminal, through Rectifier Unit L1, then to PD2, up to the Final Unit's SG terminal and finally to the 6146 pin 3.

54366. HYBRID NET UPDATE (March 22, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-22 00:04:53 UTC
From: Mark Gilger
Topic: 54366 Message: 54366

Dayton Hamvention Forum:
There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run me, WB0IQK. There were 14
stations checking in under good
conditions. There was 3 new station checking in, W4BJW, KC2KWR, and W4ALX.

We had the following number of radios checking in.

2 running TS-520(x)
2 running TS-530(x)
1 running TS-820(x)
3 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830S and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
14 stations checking in under good
conditions. There was 6 new station checking
in, K7TEH, WX4CBW, KG5CLG, KG5KIC, N7TOC, and KA0SAB.

We had the following number of radios checking in.

6 running TS-520(x)
0 running TS-530(x)
0 running TS-820(x)
1 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

He was running his TS-520 + Heathkit SB-200 amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday□s net total = 66, Sunday□s total = 46
December 2015, Saturday□s net total = 55, Sunday□s total = 73
January 2016, Saturday□s net total = 129, Sunday□s total = 81
February 2016, Saturday□s net total = 98, Sunday□s total = 72
March 2016, Saturday□s net total = 58, Sunday□s total = 35 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

From: darran byng
Topic: 54253 Message: 54369

Hi,Followed instructions and this is what i have,
Receive
terminal
210a = 262v
sg2 = 262v

Transmit
210a = 252v
sg2 = 252v

sg1 =

0v
I have traced olive coloured wire from sg2 to mode switch and have 261v.I cant get at the blue sg1 wire connection to mode switch terminal so am assuming either mode switch problem or wire to mode switch problem

Unsure of how to treat mode switch.I have contact cleaner but dont want to go spraying around unnecsesarily.I have also clicked around a bit to make sure its not a one off and noticed that when switching between cw and tune positions there is a slight audible click and meter deflection.Maybe this is normal

Anyway thanks again
73s
Darran

54370. Re: TS-820S: COUNTER FREQUENCY CALIBRATION

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-21 15:22:52 UTC
From: Paul Silverzweig
Topic: 54202 Message: 54370

So, I made the cable, but in the TS-820S Service Manual, it indicates there is a 3 contact plug for the IF side of the cable... CL1, CL2, and Ground... my cable, as described by Mike W5RKL above, has, I presume, ground and one other connection... It may be a stupid question, but which contacts should I put the two connection grabber clips on? CL1, CL2, GND?

While I have the radio open to do the calibration of the digital frequency display, I will also be installing he CW Filter, and doing the mode for the band scope adapter for the SM-220... any advice on those as well is appreciated...

73,

Paul Silverzweig

54371. RE: Connecting IF from TS-820S to SM-220 Station Monitor

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-21 19:28:37 UTC
From: n1psx@...
Topic: 52587 Message: 54371

So I am ready to do this mod, which while I asked about long ago, I never got to it... While I am doing it, I will also be calibrating my Digital Frequency Display, and installing the CW filter...

But in order not to miss anything while doing the mod for the SM220 on the TS-820S, I would ask someone who has done it, to please detail any process that might clarify what was done... the manual has the procedure spread over a number of different sections, and I simply dont want to get it wrong and damage something... and given discussions about how the manuals are sometimes wrong, I ask here?

1) Attenuation of the existing IF 2 port on the back of the TS-820S: Values of resistors? Capacitor, if any?
2) Tap for IF 1 including capacitor insertion, resistor at 8 pin jack, cutting other wires if any, and other connections needed.

Any insights you might have would be greatly appreciated...

Paul

Thank you for telling me about the canned air, I haven't ever heard that before.

In hindsight I think it's probable that I used the wrong contact cleaner. I used one that was recommended to me, yes I did read the instructions first thank you so I WOULDNT blow up my only HF radio. The cleaner says it has a lubricant in it so it will clean and protect the contact from future corrosion. I must have used too much of the stuff, because the edges of the boards behind the contacts have a thin coating of some type of liquid on them that wasn't there before.

There was no magic smoke so whatever I did when cleaning the contacts can hopefully be easily fixed. I am halfway thru the can of compressed air, I bought the 3 pack from my local Walmart today. I am typing this while waiting for it to thaw out, I intend to use the whole can and see if it will make my radio better.

Just for argument's sake, if the can of compressed air doesn't work, what else might be wrong with my radio?

Caral,
What you should be using is DeOxit D5. Only a little is needed and then after you have exercised the band switch you should blow the excess off with compressed air. You can get it at Amazon, Radio Shack, MCM Electronics and a bunch of other places.

Good luck.

You said your TS-520SE worked but after replacing the covers, the 520SE does not power up??? The only thing I can comment on is whether or not you have checked the rear panel "6 amp" fuse to see if it's blown. If it is, you will have to determine what caused the fuse to blow and fix what ever caused the fuse to blow. A pinched wire, depending on what the wire is connected to, can cause a fuse to blow (excessive current in the power transformer primary windings).

If the 6 amp fuse is blown, replace it with a 6 amp fuse but only after you have thoroughly checked the 520SE for any evidence of shorts or pinched wires.

Carol,

Here is an excellent time to use your "transformer saver" or "dim bulb"
tester. It will save the transformer and fuses.

I read and followed directions, except I waited 2 minutes for the stuff to evaporate. I will never use this stuff again. Now the only thing that works are the LED lights. The fuses are both fine, I checked. The SG switch is up. I guess it's time to take it somewhere for repairs.

DeoXit D5 contact cleaner, when used properly, will work fine. Quite
often users tend to not follow with canned air or compressed air to
remove the residual cleaner. Also it's not unusual for some techs to
apply too much cleaner which is also not good.

I apply just enough D5 to do the job then after rotating the switches or
pots throughout their rotation range a number of time, I apply generous
amounts of canned air (I don't have an air compressor) to remove any
residual cleaner. I thoroughly check the area/switch wafers etc, to
ensure I removed all of the cleaner. I've been using D5 contact cleaner
for years by following that method and I have never experienced the
problems hams have reported by using DeoXit D5. I use the same process
when using DeoXit F5 Fader cleaner and lubricant and again, never
experienced any problems.

Is the rear panel factory jumper plug, plugged into the 520SE's rear 9
pin remote VFO socket? Look at page 7, fig 2-4, in the TS-520SE
Instruction manual and you will see the factory plug and how it shorts
pins 8 and 9 when inserted into the rear 9 pin Remote VFO socket. If you
do not have the original factory jumper plug, a piece of wire connecting
pins 8 and 9 will do the same thing.

If the factory plug or piece of wire is missing, pins 8 and 9 are not
connected, then the internal VFO will not have power which results in
loss of both receive and transmit. The dial lamps and LEDs will light
and the relays will energize but there will be no receive or transmit.
Check for the factory jumper plug or a piece of wire connecting pins 8
and 9 on the remote VFO socket.

DeoXit D5 contact cleaner, when used properly, will work fine. Quite
often users tend to not follow with canned air or compressed air to
remove the residual cleaner. Also it's not unusual for some techs to
apply too much cleaner which is also not good.

I apply just enough D5 to do the job then after rotating the switches or
pots throughout their rotation range a number of time, I apply generous
amounts of canned air (I don't have an air compressor) to remove any
residual cleaner. I thoroughly check the area/switch wafers etc, to

54380. Kenwood TR-2200A question

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-23 23:01:40 UTC
From: n1psx@...
Topic: 54380 Message: 54380

I realize this is not a Hybrid Radio question, but as another post was about an older radio, I thought it might pass muster... I recently came into an old TR-2200A 2m crystal controlled channel style portable radio. I am however unable to find a manual for this particular model (found the non A version manual, but the rear panel is different) and I do not have a power supply cable for the radio... It has on the back a 3 prong DC connector that is actually 4 contact points... it is sort of like a mini SLR jack... I can of course bypass this and solder in a pigtail to get power in, but would like to find a plug that fits the jack on the back... I can post pics for anyone that is interested, or has advice on this. Or better, send me private email and I will send you the pic if you want... Any help with this would be greatly appreciated.

If this is an inappropriate post please disregard it...

Paul

54381. Kenwood VFO-820 plus other parts and pieces FS

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-24 00:43:25 UTC
From: Ken, W8EK
Topic: 54381 Message: 54381

Kenwood VFO-820 plus other miscellaneous parts For Sale:

Kenwood VFO-820 remote VFO:

The Kenwood VFO-820 was designed to work with
the TS-820 HF transceiver, but will also work with
the TS-520, and possibly others.

This remote VFO permits one to transceive from the
VFO or to work split with it. An RIT is also included.

This one has a smooth dial, and functions well.
Cosmetically, it is in extremely good condition.
As with most of these VFOs, it was missing the cable
to connect the VFO to the transceiver. I have a cable
that I used to test it that can have its stripped and
tinned ends put into the sockets on the VFO and rig.
There is no plug on either end.

Paper work is included for $100.

Kenwood MC-85 Desk Mic "Tech Special":

It looks like the silent key was working on repair of this when
he passed. All parts appear to be present, plus the addition
of a couple extra up/down switches. $45

Kenwood MC-85 Deluxe Desk Microphone Parts:

The Kenwood MC-85 will take up to three mic cords,
i.e. it is capable of being used on three rigs.

Extra cable to go from MC-85 to a Kenwood 4 pin connector,
as is used on the TS-520, TS-820, TS-120, TS-130, etc. $20

Extra cable to go from MC-85 to Kenwood round 8 pin
connector, such as is used on TS-440, TS-940, etc. $20

Linear Amp Switching Cables for Kenwood Rigs:

This cable goes from a Kenwood transceiver to a linear
amplifier to switch the amp from transmit to receive.

One end has a DIN connector, as is used with most Kenwood
rigs. The other end has an RCA phono plug, as used by most
linear amplifiers.

Before using this cable, please check the switching
capabilities of your transceiver, and the requirements

of your amplifier.

Cable for switching the T/R relay. Only $15.

Cable as above, but with ALC line in addition to T/R switching.
$22

Code Key and Cables for code keys and paddles:

Cable for straight key
About 3 feet long, with a mono 1/8 inch (3.5 mm) phone plug on it,
as used with a straight key. $5
As above, but 1/4 inch plug. $5

Cable for paddles
About 3 feet long, with a 1/8 inch (3.5 mm) stereo connector on the
end, as used by most rigs for paddles. $8
As above, but 1/4 inch plug. $8
As above, but 1/4 inch plug and coiled cord. $10

I also have many other accessories of many different brands
available.
Just too many to list here. Please e-mail your requests.

Prices do not include shipping from Florida.

Thanks.

After I figured out I had fried my rig I assumed I couldn't hurt it any worse than I already had so I went ahead and did part 2 to my rig.

https://www.youtube.com/watch?v=UMNyv49lwYI

My Drive knob is hard to turn, I am supposing that's because it hasn't been lubricated in years, I thought about using that cleaner on the Drive shaft and associated bells and whistles but decided against it.

There is still a lot of wet where I sprayed that cleaner. What will I hurt on the radio if I take a cotton swab to the edges of the boards to remove excess lubrication? Or should I just use the canned air?

54383. Effectiveness of YK-88SN SSB Filter 1.8 kHz

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-24 03:53:13 UTC
From: louiswilen@...

Environment: TS-530S, owned since new, no mods. I installed the 270 hz and 1.8 Khz filters shortly after purchase in 1982.

The 270 Hz filter has always worked superbly, but I've never been happy with the 1.8 kHz SSB filter. Although it's easy to hear that it narrows the audio bandwidth when switched in, it seems to do very little to actually reject adjacent QRM.

Are others seeing similar characteristics with this filter? I'm wondering if I received a dud or if what I'm hearing is just typical of 1.8 kHz filter from the 1980's.

Any chance that I installed it wrong? As I recall, it was a simple installation. Just put it in the right slot, solder, and you're done.

Topic: 54355 Message: 54384

Carol,
What symptoms were you experiencing that, through troubleshooting, indicated you should go into your 520SE and do the cleaning of the wafer switch and the bottom relay terminals as shown in the video? I read your initial post again and did not find where you stated any problems you were experiencing. You simply said:

Has anyone ever cleaned the contacts in the radio and have the radio stop working?
which indicates to me the 520SE was working, no problems were indicated, before you followed what the video showed.

I must say, I watched the video and it was clear to me the person in the video did not know how to properly apply contact cleaner. He applied entirely too much cleaner and never followed with canned or compressed air to remove the excessive amounts of residual contact cleaner. He did say, he had to work "quickly" as the cleaner would "evaporate" quickly. I was surprised to see the 520 didn't ignite into flames based on the excessive amount of contact cleaner he used. Deoxit D5 does not evaporate quickly, as you found out based on your recent response that said:

There is still a lot of wet where I sprayed that cleaner.
An easy method of using contact cleaner to clean wafer switches, such as the band switch wafer switches in the 520SE, is to use a child's old soft tooth brush, wet with contact cleaner, then gently, let me say that again, "Gently" rub the tooth brush over the switch wafer then rotate the wafer switch 3 to 4 times throughout it's rotate range. This method "limits" the amount of contact cleaner applied to the wafer switches plus it provides a "light scrubbing" action to remove corrosion and dirt. Again, notice I said "Gently" rub the switch wafers with the soft tooth brush!!! Do NOT scrub the wafer switch like you are scrubbing burnt food from a frying pan with a scrub sponge as that can lead to damage to the wafer switch!!! This method does not apply to all wafer switches since some wafer switches cannot be accessed with a soft tooth brush. The cleaning process should be followed by using generous amounts of canned or compressed air to thoroughly remove any residual contact cleaner. A thorough inspection of the switch wafer and/or area contact cleaner was used, should be done to ensure there is no residual liquid cleaner remaining.

Since there is still quite a bit of liquid remaining, I recommend using generous amounts of canned air or compressed air to remove any/all of the remaining liquid contact cleaner. The can will feel cold after use and the pressure will drop somewhat. Do not turn the canned air can upside down or side ways to gain access to certain areas. Also do not shake the canned air can!!! The canned air label clearly states do not shake!!!
I cannot say that performing the above procedure to remove the remaining "wet" cleaner you see in your 520SE will fix your problem, make your 520SE work again. I can only say I would never have applied DeoXit D5 in the manner shown in the video!! There are other actions/comments I saw in the video that I disagree with but that's left for another day.
I mean no disrespect Carol but you did not specify what level of electronic and troubleshooting knowledge/skills you have. Servicing KW hybrids is not an easy task. Servicing your 520SE requires knowledge in electronic, knowing what each stage in your 520SE does and how the receive and transmit signals are processed/produced. It also

requires test equipment and the knowledge to properly use the test equipment and understand and what steps to take based on what the test equipment is showing you. If your level of knowledge and troubleshooting skills is very limited then i recommend you find a local ham who has the knowledge and troubleshooting skills along with the necessary test equipment to help you service your 520SE.

Brad,

Good call. Louis may want to look at page 23 in the instruction manual. There are jumpers that must be dealt with depending on the type of filter installed.

I just purchased a 530sp and it seems to do something similar. It narrows up the audio but the filter is not very effective.
It looks like this rig was untouched for many years. Im waiting on my capacitor pack to show to get the finals working properly again. It is otherwise a very clean rig.

From: Mike
Topic: 54383 Message: 54388

I had a (somewhat) similar experience to that of W3VVV, when I first purchased a used TS-530 about 15 years ago and installed a YK-88CN (270 hz; CW "narrow") filter. I used it for a while (CW) but was not satisfied with the sound of it. I came to the conclusion (but without actual measurements) that the loss was excessive, and replaced it with a "wide" CW filter (YK-88C; 500 hz). The YK-88C worked much better (despite the wider bandwidth) so I have since stayed with it.

I never did do any actual measurements of the YK-88CN; it's still sitting in my junk box. Perhaps there were some defective (or not very reliable in the long-term) filters, both SSB and CW, that found their way into Trio/Kenwood's distribution network.

I do agree with K3DWB's suggestion- make sure that the jumpers are correctly configured, and that the filters are installed in the correct slot(s) corresponding to the jumper settings, per the user's manual.

Mike,

I've been following this thread with great interest.

I repair mostly legacy Collins Radio gear. I agree wholeheartedly with your comments about cleaning. I would like to add some additional cleaning tips.

I have had very good results cleaning band switches using only lab grade alcohol. Matter of fact, I've stopped using DeOxit entirely on these switches.
With lab (reagent) grade alcohol, I can remove most, if not all, the oxidation that forms over time. Advantages of alcohol are almost instant evaporation and zero residue. I apply with a fine bristle dental brush. A cotton swab works equally well. If using a cotton swab, be sure to use a type that's designed for lab or electronic use. Drug store variety have too much lint.

The only place where I continue to use DeOxit is on pots. Here I use their "Fader Lube."

I've seen way too much electronic equipment rendered useless over the years by improper "cleaning."

Best Regards,
Steve, N6HK

Ok, Initial symtoms. I had noticed that on the 80 meter band (3.5mhz on the radio) I would loose all speaker noise and sometimes plate current. Usually only happened for a few minutes and then the sound would come back. Originally it ONLY happened on 80 meters and ONLY for, like 15 minutes. It worked well on all other frequencies so I took the radio to Bryson City NC to use it with my club for the NC QSO Party. We set up wire dipole antennas in the trees the night before and connected the different antennas to different radios. They chose my rig for the 80 meters antenna even though I told them about the problem. We fired her up and I tuned her according to the manual. She worked fine the first hour, then she would suddenly stop all sounds from the speaker. The ALC meter was still deflecting as if it was receiving, but no audio. No sound even with headphones plugged in, so we figured it wasn't a speaker or speaker wire problem. If no one touched the rig the sounds would suddenly snap back on and work for a few more minutes. When the frequency was changed we'd loose sound again. While there was no audio we could turn the knob from LSB to CW and get sound back, only to loose it again when we switched back to LSB. I say We because all the Extras present who had experience with tube radios had a look at her, and took turns trying various things, including different tune up procedures. One gentleman noticed that when he turned the FUNCTION knob from VFO to R.VFO he sometimes got sound back. The problem eventually escalated to no audio on any band, any frequency, from the headphone jack OR the speaker, and then audio would come back. This ham suggested that my FUNCTION contacts probably needed to be cleaned and to clean each contact 3 times before I fired up the rig and to make sure I let the cleaner evaporate. He didn't mention following the cleaning with canned air either. Eventually my rig was pulled and a backup rig was used for the QSO Party.

Experience? I have never tried to repair a radio before and since this is my only HF rig, I have tried to be very careful with it. My Dad helped me pick it out, assuming he would be here to help me learn about it and to fix it since he was an electronic engineer, and very familiar with tube electronic equipment, but he is now a SK. I tried very hard to not blow up my radio. I have repaired a cell phone, made a tape measure Yagi, a travel folding dipole 2m/70cm antenna, a solar cell phone charger and replaced a laptop screen, (all with printed out instructions beside me), but I haven't ever worked on radio equipment, let alone vintage equipment. When I got home I solicited more info from other hams in a different club. Those hams helped me take the cover off and told me I could unplug the speaker wire, and watched over my shoulder to make sure I didn't hurt the wires when I unplugged them the first time. They explained how to clean the contacts, and it was just like how the first ham had told me. The complexity of the machine impressed and intimidated me so I searched the internet for more contact cleaning instructions and hit on the youtube vids. Cleaning like in the video seemed to solve the audio problem, only I couldn't fully test the rig before it quit working so I don't know for sure.

I have mostly basic theoretical book knowledge of electronics and their components. My baby girl (520SE) helped me pass my extra test because I memorized the tune up procedure and I learned some about the vacuum tubes from the manual and the QSO Party troubleshooting session, both of which were on the test. I know what the components are but not what they look like in my rig.

I can't bake a batch of cookies without printed instructions clothespinned to a convenient cabinet, but I am very good at following directions. I looked for some kind of walkthrough for troubleshooting my specific rig and have come up with bits and pieces. I do have both the user manual and the service manual and have read both. I searched the troubleshooting section of the user manual for anything similar to my problem but nothing is an exact match. I have a Harbor Freight multimeter and I've inherited my dad's ocilliscope that I need to print out a manual for, and I can scrounge thru his radio shack to see if he has any other test equipment I may need.

That radio is still wet. By 'wet' I mean I have taken my finger twice this week, 3 days apart and slid it down the edges of the boards beside the contacts on the BAND shaft. My finger has come back wet both times, even AFTER the canned air treatment yesterday. I can see liquid drops that I am assuming is lubricant moving on the band shaft when I spray the air. I applied generous amounts of canned air to the FUNCTION contacts to try to dry up the liquid. When I say 'generous' I mean I sprayed so much the can completely froze up twice and I had to let it thaw before I could use it again. I read the instructions on the can to learn how to use the stuff, I am not shaking, turning or twisting the can at all when I use it, spraying in short bursts.

I did find this website today that you have posted on:
http://forums.qrz.com/index.php?threads/ts-520-ts-520-se-after-long-storage-vfo-squeging-instability.486732/

This was part of a comment posted farther down under your comment:' (using a piece of postcard soaked in switch cleaner pushed in and out between the contacts till the dirt stops coming off)"

Would using an index card in that manner work to help get the excess cleaner off? It has also been suggested to me that maybe a piece of dirt has gotten caught in the FUNCTION contacts, preventing a good connection. Is that a possibility? wouldn't the canned air have moved the dirt by now?

Troubleshooting I have done:

I have checked the little caps for signs of failure and come up empty, I checked the bottom of the big electrolytic capacitors in the middle of the rig. They seem to be original and in fair shape, no cracking or bulging I can see except for the small bulge I think is supposed to be there. I checked the smaller black electrolytic capacitors that are located in the bottom right of the bottom of the rig when it's on its side and one of them shows very faint cracking and maybe brown leakage (that might just be glue drip.) The blue sideways capacitors seem to be fine. The fuses are intact, the original VFO plug is fully inserted, the SG switch is up, the voltage switch is set to 120V, and there are no broken, pinched or disconnected wires that I can find. I have not, and would prefer not to, taken the High Voltage cover off the final tubes to inspect that section. I got shocked in the belly by my washing machine once, my OM had to bring me his special work shoes to get me out of the basement. I am NOT keen to ever repeat the 'shocking' experience.

The only thing I know of that I broke on the radio is the small black plastic dohickys that hold the small door onto the radio to cover the bias control and other knobs on the side. I know where to get replacements for those and replacement seems to be pretty straightforward, I think I can do that by myself.

Dad had a copy of 'Elements of Radio Servicing' by William Marcus, M.S. and Alex Levy, B.S copyrighted 1947 that I am in the process of reading. I am going to exhaust this can of compressed air on the contacts, and I have club meetings next week with both of my clubs and I will try to set up an appointment with one or two of Dad's former co-workers to look at the rig. I would like to learn what I broke with the cleaner and help to fix it, but if I need to send it off I will.

Beyond the simple things I have done already or plan to do, I will need clear directions for any further testing, including what NOT to touch. Thanks!

Dad sure loved being a radio repairman. I just did a rough inventory of his testing equipment, I bet if you name it, he's got it :-) I just found his VTVM and a whole lot of other radio testing goodies. I will be looking up manuals for all this stuff the rest of the afternoon. :-)

I've had the 1.8KHz filter installed on my TS-430 for several years now.
It's an absolute survival necessity on Field Day. It's not a magic
brick wall DSP IF filter, but it makes the feeding frenzies on 15 and 20
survivable.

Carol,

After reading your description of the trouble, I suggest the following :

1. Cease all further trouble clearing efforts until you can acquire the TS-520 Service Manual. That manual has all of the test points and voltages that should be seen at various points in the radio. In addition, it gives exploded views of the individual circuit boards.

2. No more canned air. Obviously way too much DeOxit was applied. All you're doing now is blowing the oily substance around the inside of the rig.

3. You might try to just a clean the band switch and mode switch with a good grade of alcohol on a swab. This to remove the solvent that's in the DeOxit. That oily solvent probably has your switch contacts all gummed up. That could explain why your '520 appears to be "dead."

4. If after trying the above, and radio is still malfunctioning, find someone at your club(s) that has a VTVM with r-f probe. Because you'll need to check r-f levels through the unit to see where you're loosing the signal. Before you level check, perform voltage checks through the radio in conformance with the Service Manual.

5. If you don't feel comfortable around the voltages you'll be encountering inside the rig, find a willing Elmer to assist you.

Best Regards,
Steve, N6HK

I have the service manual for the TS-520S which is very close to the TS-520SE except for AC / DC power option and heater switch. The 520S model has the Heater switch and AC/DC power options but the TS-520SE does not have those options. The TS-520SE has a WID/NAR filter select for CW the TS-520S doesn't have.

The TS-520S service manual can be downloaded at my website

http://w5rkl.com/wp-content/uploads/2014/04/TS520S_service-manual.pdf

I do have a high resolution schematic (following link) of the TS-520S which is similar to the TS-520SE high resolution schematic but on one page, no taping sections together. You should find a place to print the schematics on larger paper so you can tape them to the wall while working on the radio.

http://w5rkl.com/wp-content/uploads/2014/04/TS-520S_LARGE-Schematic_Hi-Res.pdf

I have an abbreviated TS-520SE service manual plus a high resolution schematic of the 520SE at the following links:

TS-520SE Abbreviated Service manual
http://w5rkl.com/wp-content/uploads/2014/04/TS520SE_serv_reduced.pdf

TS-520SE high resolution schematic with voltages
http://w5rkl.com/wp-content/uploads/2015/02/TS-520SE-HiRes-Schematic.pdf

You will have to print the TS-520SE 3 page schematic then tape the sections together.

I also use welder's soft brushes, at least I found them in the welders equipment section of our local farm/home hardware store. The brushes typically, come in a pack of 5. They work great to clean wafer switches in tight places. The brushes are soft and when wet with cleaner, one can gently brush the cleaner over the wafer switch without having to spray cleaner from the can onto the wafer switch. Follow with canned or compressed air to remove residual cleaner. The only problem I have found using this soft brush is having to remove the bristles that tend to be pulled from the metal handle. I use surgical Forceps (clamps) to remove the bristles. They also come in handy when removing screws, washers, and nuts that fall into tight spaces where your fingers won't fit. Forceps can be found on eBay, Harbor Freight, and surgical outlets. I keep 4 or 5 of them, always find some use for them.

Hi Folks,

I've been following this and I suspect a few folks may have missed something. She never said she used DeOxit. She said she used a cleaner with a lubricant in it that was recommended to her by a friend. Radio Shack and, I'm sure others, sell a cleaner/lubricant that leaves a whole lot more oily residue than DeOxit and it never really dries up. Too much of this stuff would really make a mess. I'm wondering if some of this may have found it's way into a relay or two and who knows what else. I think she is going to have to use alcohol and carefully try to clean the oily film off as many contact areas as she can. You guys forgot more than I'll ever know, but I wanted to clear this up in an effort to help.

Hi Carol,

Gotcha. When you said someone recommended a cleaner and it had a lubricant that was leaving liquid residue on the boards, I assumed it wasn't Deoxit. I have such a cleaner, but I only use it on pots and very sparingly at that.
I still feel you should clean things as best you can with alcohol. Sorry I can't be of more help. I hope you get it resolved.

Also forceps can be found in the fishing department at Walmart, I own a few. Great for working hooks out of unruly turtle mouths.

I printed out the service manual today, I will get the hi-res schematic and find a place to print it this weekend. I found a VTVM of my dads but can't find the manual at the house or online. I can't find the probes either but I have been told they are very easy to homebrew....(If anyone can recommend a link to instructions I would appreciate it)

Also if anyone can recommend a place to look for the 'good' cleaning type of alcohol I'd appreciate it.

Thank you for the responses, everyone.

I checked the jumpers and they are set correctly. I actually followed the instructions correctly in 1982 when I was a new ham!

Just to clarify -- the narrow SSB filter definitely works, but just doesn't have the razor sharp performance that I had hoped for. This is probably more of a case of unrealistic expectations than anything else. Anyway, thanks again for the responses.

Do your test against a steady tone. Slow CW is OK as it’s bandwidth is very low. If you are judging the filter based on a SSB signal it’s almost certainly not your rig but rather the sideband skirts that are present on almost all SSB signals.

I have a TS-530SP with Kenwood 1.8 KHz and 500 Hz filters installed, with the jumpers set so that the 1.8 KHz filter is my wide filter for CW. For SSB I like to first tune with the stock SSB filter and then switch in the 1.8 KHz filter, which I find cuts down on broadband noise. As far as adjacent channel selectivity I don’t find it to have “brickwall” characteristics. As an alternative you might consider the 2.1 KHz INRAD filter which is supposed to have much steeper skirts. Go to their website for comparisons.

Carol,

What is the make and model of the VTVM?

If you do not have nor can you find the original probes, a simple "pair" of AC/Ohm and DC probes can be made using Velleman TLM6 hollow plastic probes (sold on eBay and other sources), a length of stranded hook up wire (found at auto parts or hardware stores), a series 1meg resistor 1/2 watt resistor (the 1meg resistor is used ONLY in the DC probe) and a connector to the VTVM (Heathkit used 1/4" mono plug). I have an Eico 232 VTVM and I changed the front connector on my Eico 232 VTVM to a "BNC" female socket. The original socket/connector was that "screw on compress" connector which I never cared for so I changed it to a BNC socket and made a pair of AC/Ohms and DC probes using the above materials.

You should have an RF probe which you can make yourself. I made my RF probe using 1/2" diameter PVC pipe found at the local hardware store. The other components were easily found on eBay. You can duplicate the Heathkits PK3 RF probe from the PK3 schematic which you can download from my website at the following link:

http://w5rkl.com/wp-content/uploads/2015/02/Heath-PK-3.pdf

I have a picture of the home made RF probe I made on my website:

http://w5rkl.com/equipment-photos/

The body of the RF probe is 1/2" diameter PVC pipe with end caps. The length of the body is approximately 2 1/2", includes the portion of the pipe inside the end caps.

The components I used are as follows:

3 x NTE109 diodes (NTE cross reference to the 1N191 diodes Heathkit used)

1 x .1ufd 1KVDC disc cap (A .01ufd to .1ufd cap will work, I just happened to have .1ufd 1KVDC disc caps)

1 x 4.7meg 1/2 watt resistor (Metal foil or Metal Oxide available at Mouser.com or other on line sources work fine)

1 x 15 inch RG8x coax cable (other shielded cable such as RG-174 or other shielded cable will work)

1 x 1/4" mono plug (depends on the socket on your VTVM, Heathkit used 1/4" mono sockets in their VTVMs)

1 x Velleman RED/BLACK hollow plastic probe set (only used the BLACK probe cut to a short length then drilled a hole in the end cap so the probe fits snug. You may need plastic/PVC glue to hold the probe tip in place).

The copper coating around the body as shown in the picture of my home made RF probe is copper tape cut to fit around the body of the probe. The tape can be found on eBay. The copper tape acts as a shield and is connected to the ground (shield) of the coax cable. The home made RF probe has a maximum RF voltage of 90 volts with a maximum DC voltage rating of 1KVDC. I have compare the home made RF probe against the Heathkit PK3 RF probe and the RF level test results were the same. The RF probe, as wired in the schematic, simply rectifies the RF signal into a "Negative" DC voltage and that DC voltage is applied to the VTVM with the VTVM set to measure "negative" DC voltage.

The TS-520SE has 2 relays, labeled RL1 and RL2 on the schematic. Both relays are enclosed relays, plastic covers over the relay frame.

Relay RL1 is located below the VOX and MARKER Unit boards on the top left rear of the transceiver. This relay is held in its socket by a wire hold down clamp. The wire hold down clamp will come off rather easily but it takes a bit longer and more patience to put it back on.

Relay RL2 is shown in the video link in Carol's post, shows it inside the final amp's S5 wafer switch enclosure. Relay RL2 in the TS-520S and TS-520SE is located inside a "small" metal enclosure between the S5 wafer switch enclosure and the rear panel. There is no relay inside the TS-520S and TS-520SE final amp S5 wafer switch enclosure.

Unless Carol sprayed contact cleaner "everywhere" then I seriously doubt the relays were contaminated with contact cleaner.

you do not want to use any spray type cleaner on anything that has a fibre or phenolic switch , it will absorb the lubricant and over time become conductive especially if there is a high (over 250) voltage on the switch . if that is what has happened the entire switch or the individual wafers will have to be removes and soaked in alcohol to get that out if the affected wafer(s) does not already have a carbon track on it .
A lesson I learned repairing Tube type televisions when they still had them . you especially want to keep it out of the high voltage (5000 and 25,000) volt areas .

Mike,

I was told by someone that the Deoxit was what I needed to use to spray wafer switches. Now, I'm not too sure if this stuff is exactly what is needed for occasional maintenance .

If you can advise, I would appreciate it. I understand that you should use, with a certain Amount of common sense, and not to excess. LESS IS BETTER

George,
Yes, Deoxit D5 is what you would want to
use. Just make sure you blow the excess off with
compressed air after spraying. Have fun.

I have said many times on this and other ham forums/groups, when cleaning switches, pots, and stiff bearings, use just enough cleaner to perform the cleaning/unfreezing process then follow with generous amounts of canned or compressed air to remove any/all cleaner residue.

I have been using DeoXit D5 as well as Deoxit F5 Fader cleaner/lubricant for years to clean VFO, LMO, Final Amplifier LOAD, and PRESELECTOR variable capacitor frame to shaft connections, wafer switches, slide switches, and pots as well as to "unfreeze" stiff Mode, Function, and Band switch bearings. I have never experienced the damage/problems some people seem to be having when they used DeoXit D5 / F5 cleaner/lubricant!!

George,
Mark is right, Deoxit D5 can be safely used on wafer switches and slide switches. Just follow the cleaning process with generous amounts of canned or compressed air to remove any/all cleaner residue. As I said in a previous response to this thread, you can also use a child's soft tooth brush wet with contact cleaner to give a "light gentle" scrubbing actions followed by generous amounts of canned or compressed air to remove any/all cleaner residue from the wafer switch and surrounding area. Visual inspect the switches and surrounding area to ensure you remove all the cleaner. This takes a bit longer but it's worth the effort. Also follow the cleaner's warning label!!!! Don't be in a hurry!!!

I do NOT recommend you follow the cleaner application method shown on the video!!!! I shook my head when I watched him apply the excessive amounts of cleaner at the band wafer as well as the FUNCTION (He called it the VFO switch), and the MODE switches.
Yes, when using contact cleaner, whether it's alcohol, flammable or non-flammable D5 or F5 use some "Common Sense"!!! Do NOT apply contact cleaner to the switches in the same way you would when applying Windex to clean a window!!!

Amazon is a good place to get DeOxit. If you
want to use a bottle with small brush, they have
it in the D100 (Full Strength).

http://www.amazon.com/Booster-Electric-Connection-Enhancer-Lubricant/dp/B0002BBVN2/ref=sr_1_12?ie=UTF8&qid=1459038342&sr=8-12&keywords=deoxit+d5

For some applications a pen applicator might work out best:

http://www.amazon.com/DeoxIT-Pen-NSN-6850-01-477-1444-100%25-solution/dp/B001EQ7H82/ref=sr_1_17?ie=UTF8&qid=1459038453&sr=8-17&keywords=deoxit+d5

Of course you can also obtain this from Antique Electronics Supply:

https://www.tubesandmore.com/search/node/deoxit

54415. TS-530S Speaker Volume Issue

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-27 03:58:45 UTC
From: nw0m_mitch@...
Topic: 54415 Message: 54415

I just re-acquired my TS-530S and after testing it out I found one issue:

With the AF Gain turned fully counter-clockwise to setting Ø, there is still speaker volume. And the volume is at a moderate level for comfortable listening but it can't turn down further or completely off. Also, I cannot turn the AF Gain past setting 2 without getting a blasting volume level. Everything else appears to work OK. Any ideas?

Thanks, Mitch

From: Mike W5RKL
Topic: 54415 Message: 54416

Mitch,

Have you tried cleaning the volume control with DeoXit D5 or DeoXit F5 Fader cleaner/lubricant, not both?

Based on your statement it appears the control is dirty and needs cleaning. Use just enough cleaner/lubricant to do the job. Apply a very small amount of cleaner/lubricant (press down slowly on the cleaner can's valve and when cleaner/lubricant begins to spray into the control release your finger from the valve). This should apply a very small amount of cleaner/lubricant into the control.

Rotate the control several times throughout its range.

Apply generous amounts of canned or compressed air to the control and surrounding area to remove any/all cleaner/lubricant residue. Visually inspect the control and surrounding area, repeating the application of canned or compressed air to remove any additional residual cleaner found. You can find canned air, labeled as "Electronic Duster, Commercial Strength" in Green Can or "Dust Off" in black can, they both are exactly the same, at Walmart CD/Cell Phone/TV department or at Harbor Freight stores.

When applying canned air, do NOT turn the can on its side or upside down!! Always keep the can upright as much as possible. The "White" spray, if can it turns on its side or upside down, is VERY COLD. The can will feel cold when in use, this is normal. DO NOT shake the canned air can!!!!

Wait between 2 and 4 minutes before applying power (see warning on the cleaner/lubricant's can).

Providing there are no other problems, this should fix your volume control problem.

He says the audio is getting through when the pot is at zero, so how can it

be a dirty pot? Also it is very loud past 2, so again how would dirt on the pot make it go even louder. The earth is the problem.

David,

I do not know what Mitch meant by "Re-acquired my TS-530". Was the TS-530 on loan to a ham friend or was the TS-530 stored in a closet, basement, or garage for quite a long time? Only Mitch can answer that question. Regardless of the answer to what Mitch meant by "Re-acquired my TS-530", I still would have recommended he try cleaning the pot first. If, after cleaning the pot, the problem still existed, then move to troubleshooting the audio circuit including the volume control.

As I said at the end of my response,

"/*Providing there are no other problems, this should fix your volume control problem.*/"

Reacquired means he owned it, sold it, and later bought it back from the same fellow he sold it too.

If it was just a dirty pot then I would expect the volume to drop out from the insulating effect of the poor contact to the pot rotor, plus some of the usual crackling sound on rotation. But he’s saying with the pot at zero, the sound is not off. Sounds like the ground side of the pot has lifted for some reason. But I’m not sure how that would physically occur though.

Mitch,

Have you tried cleaning the volume
control with DeoXit D5 or DeoXit F5 Fader cleaner/lubricant, not both?

Based on your statement it appears the control is dirty and needs
cleaning. Use just enough cleaner/lubricant to do the job. Apply a very
small amount of cleaner/lubricant (press down slowly on the cleaner can's
valve and when cleaner/lubricant begins to spray into the control release
your finger from the valve). This should apply a very small amount of
cleaner/lubricant into the control.

Rotate the control several times
throughout its range.

Apply generous amounts of canned or compressed
air to the control and surrounding area to remove any/all cleaner/lubricant
residue. Visually inspect the control and surrounding area, repeating the
application of canned or compressed air to remove any additional residual
cleaner found. You can find canned air, labeled as "Electronic Duster,
Commercial Strength" in Green Can or "Dust Off" in black can, they both are
exactly the same, at Walmart CD/Cell Phone/TV department or at Harbor
Freight stores.

When applying canned air, do NOT turn the can on its
side or upside down!! Always keep the can upright as much as possible. The
"White" spray, if can it turns on its side or upside down, is VERY COLD. The
can will feel cold when in use, this is normal. DO NOT shake the canned air
can!!!!

Wait between 2 and 4 minutes before applying power (see
warning on the cleaner/lubricant's can).

Providing there are no other
problems, this should fix your volume control
problem.

still hearing audio at the 0 end of the control can be 2 reasons .
the pot has a stop to keep it from being turned so far as to get the wiper off the resistance .
the connection between the carbon element and the rivet has high resistance or poor contact to ground .

the sudden change in volume as it's turned up usually only has one cause , most likely cause is the element has a tiny crack at that point and is no longer connected at the ground end . once the wiper is past that point there will be no control over the volume .

Hi Mitch,
I have twice seen a problem where there was still speaker volume with the pot turned all the way down. I disconnected the wire to the wiper and measured the resistance between the wiper and the grounded end. In both cases I found that resistance between the wiper and the grounded end of the pot was not zero or close to zero with the pot turned fully down. FaderLube did not fix this. Both were on Heathkit rigs. I was lucky that I had some replacement pots available.

I agree with Mike, first try cleaning. My original 830s developed exactly the same problem. It hadn't been turned on for 3 months. Unfortunately, I couldn't save the pot and sourced replacement from our good friend Walter Dilley. Not a pleasant job to do, especially if wanting to look like OEM.

Mitch

You can let us know what you found, whether it's a missing and fixed ground at pin 1 on the volume control or plug 3 pins 2 and 4 (see below picture) or by cleaning the pot with contact cleaner and canned / compressed air fixed his problem.

I cut and pasted the volume control as it is shown on the TS-530S service manual schematic. The board plug 3 the pot connects to is on the AF Unit board.

Note how the 2 shielded cables have their shields connected together then connected to pin 1 on the volume control. The shields of both cables also connect back to the AF Unit plug 3, pins 2 and 4, both which are labeled "G" for "Ground".

You should be able to use an ohm meter, RED probe connected to the volume controls Pin 1 and the BLACK probe connected/touching the chassis and see "zero ohms or continuity"!! If you see this then the volume control has not lost its ground on pin 1. You can visually inspect the volume control as see the shields connected together at the volume control's pin 1.

If you do not have the TS-530S service manual then you need to download it and use it when servicing your TS-530S!! You can download the TS-530S service manual from my website

www.w5rkl.com

in the documents and manuals link. Once the documents and manuals page comes up, scroll down to the Kenwood section and click on the TS-530S service manual link, the manual will download to your computer in pdf format.

54428. Re: [TS-520_820_530_830] TS-530S Speaker Volume Issue

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-27 22:26:37 UTC
From: Mike W5RKL
Topic: 54415 Message: 54428
Attachments: 1 described; binary payloads are missing from this source WARC

The test I mentioned in my previous response using an ohm meter connected to pin 1 and the chassis only checks for loss of ground between pin 1 and plug 3 pin 2 or 4 "G" (ground) connections. It does NOT check for a fractured internal element in the pot.

To check the pot for a fractured internal resistive element, wire to pin 3 will need to be disconnected then connect your ohm meter between pins 1 and 3 should display infinity indicating a fractured internal resistive element.

54429. Hybrid Net Update (March 27, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-28 02:17:18 UTC
From: Mark Gilger
Topic: 54429 Message: 54429

Dayton Hamvention Forum:
There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run me, WB0IQK. There were 16
stations checking in under good
conditions. There was 3 new station checking in, KA2DAS, W8JWE, and WD8T.

We had the following number of radios checking in.

3 running TS-520(x)
2 running TS-530(x)
4 running TS-820(x)
5 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830S and Drake L-4B amplifier.

There was no Sunday net due to a DX contest that
was making a mess of the frequency.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 ☐ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday☐s net total = 66, Sunday☐s total = 46
December 2015, Saturday☐s net total = 55, Sunday☐s total = 73
January 2016, Saturday☐s net total = 129, Sunday☐s total = 81
February 2016, Saturday☐s net total = 98, Sunday☐s total = 72
March 2016, Saturday☐s net total = 74, Sunday☐s total = 35 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

73's,
Mark, WB0IQK

54430. TS-530S Speaker Volume Issue Part II

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-28 01:19:43 UTC
From: nw0m_mitch@...
Topic: 54430 Message: 54430

Not sure what is going on with the message board as I sent a reply today, March 27, at 1800Z that never posted. Now it won't let me post a reply to my original message thread. But it will let me create a new one...

Thanks for the many replies and suggestions.

First off, Jeff AC0C, is correct in my re-acquiring my old radio. The previous owner thoroughly cleaned and re-aligned the radio.

I had already tried the DeoXit on the AF Gain pot but that did not resolve the issue. It does not sound or act like a dirty pot.

Here's another oddity (to me anyway) that when there is NO antenna connected, the AF Gain works properly to adjust the volume of the hiss noise. Turning AF Gain fully counter-clockwise turns OFF all hiss noise. And I can turn the pot higher for increased hiss noise as expected. Does that make any sense???

The good news is that I have the radio connected to an external speaker that has a Mute. The other good news is that even with the AF Gain at 0, the volume level is at a comfortable volume level both for the external speaker and headphones.

73, Mitch

54431. Re: [TS-520_820_530_830] TS-530S Speaker Volume Issue Part II

Yahoo group: TS-520_820_530_830 (2015 — 2016)

From: Lou Blasco
Topic: 54430 Message: 54431

Hi Mitch,

As you've now told us you've used Deoxit on the pot we can probably discount the dirty pot scenario. However, as has been mentioned by others the symptoms you have given us indicate that the track on the volume pot may be broken near the ground end.

Why is it so? Look at the partial circuit Mike provided and the one below then imagine what would happen if the track was broken just above terminal 1. You would still get audio passing from AV3 (output from the audio driver Q2) to AV2 (input to the speaker amp Q6) depending on the position of the wiper.

Emacs!

Your initial description of the fault tells me there is something wrong with the pot. Have you followed Mike's suggestions and checked the wiring and the volume pot with a multi-meter?

I'm sorry to say that the good news you reported your last post is not good news because you still have a problem. That you can hear anything in your headphones with the AF gain set to 0 means the problem persists. I expect the reason that your headphones are a comfortable level is due to R21 & R22 on the headphone jack. Does your external speaker have a level control or did you plug it in to the headphone socket? That would explain the comfortable volume there.

Emacs!

At least 8 people have invested time & effort to your request for assistance. While you owe us nothing I'm sure we would all be interested in seeing this problem resolved properly.

Hmmm,

For whatever reason the circuits I posted with my email did not come through. In any case that parts of interest are the circuit of the AF unit around board plug 3 and the main interconnect diagram showing the wiring between board plug 2 (pins 5 & 4) and the headphone socket and speaker wiring.

Mitch,
You said:
Here's another oddity (to me anyway) that when there is NO antenna connected, the AF Gain works properly to adjust the volume of the hiss noise. Turning AF Gain fully counter-clockwise turns OFF all hiss noise. And I can turn the pot higher for increased hiss noise as expected. Does that make any sense???

With the antenna disconnected and the Marker turned, tune the VFO at a 25Khz interval on the dial for a beat note heard in the speaker. Adjusting the volume control CW and CCW, do you hear the same "normal" volume control results as your above statement says????

You also said:
"The good news is that I have the radio connected to an external speaker that has a Mute."
"Has a Mute"? Is that a front panel switch or what?

Hi Mike,

Thanks for your many replies.

When I did as you asked below, after finding the beat note, it is FAINTLY heard at AF Gain fully counter-clockwise using headphones. Also, I can faintly hear the hiss at other frequencies on the headphones. For the external speaker I have to put my ear next to the speaker to faintly hear the hiss or beat tone for AF Gain 0.

Yes, the Yaesu external speaker has a Mute button on the front panel.

Thanks again.

I have the SP230 Mike, and it has an A/B switch on the front. He might be meaning that. If I have no input on the B side, naturally it acts like a "mute" button.

Hi Lou,

Thanks for your comments. Let me answer your questions first.

In the thread I did not see any circuits posted by Mike. But that is why I posted the 'oddity' that the AF Gain works fine without an antenna connected. Does that change anything?

I have not had time to check the pot with a meter. The holiday weekend was busy and may not have time until later in the week to actually get into the radio internals.

The reason I called it 'good news' is that the radio is perfectly usable as is. Of course if the condition worsens that is another story.

No, the Yaesu external speaker does not have a level control and is connected to the rear speaker jack on the radio. It has a Mute button to 'turn off the volume'.

Thanks again.

73, Mitch

Hi Mitch,

As you've now told us you've used Deoxit on the pot we can probably discount the dirty pot scenario. However, as has been mentioned by others the symptoms you have given us indicate that the track on the volume pot may be broken near the ground end.

Why is it so? Look at the partial circuit Mike provided and the one below then imagine what would happen if the track was broken just above terminal 1. You would still get audio passing from AV3 (output from the audio driver Q2) to AV2 (input to the speaker amp Q6) depending on the position of the wiper.

Emacs!

Your initial description of the fault tells me there is something wrong with the pot. Have you followed Mike's suggestions and checked the wiring and the volume pot with a multi-meter?

I'm sorry to say that the good news you reported your last post is not good news because you still have a problem. That you can hear anything in your headphones with the AF gain set to 0 means the problem persists. Mitch,
You answered only part of my question. You only stated the level of audio heard in the headphones and external speaker (very faint in both) with the volume control set fully CCW (decrease audio output) with the VFO tuned to the Marker beat note at a 25Khz VFO dial interval.
You did not state how the audio response was when you rotate the volume control "CW" past 2 (increase audio output) with either headphones or speaker connected and with the antenna disconnected???

Mike,

The audio level increases while rotating volume control CW past 2.

Just to be clear, the audio volume also increases past 2 with antenna connected. It's just that at 2 it is loud enough to hear throughout the entire house. I would guess that at my volume level setting of 2 equals what it should be at setting of 6-7 or so. It goes from a comfortable listening level at 0, loud at 1, and too loud at 2 sitting at the radio.

HI Mitch,

Don't know what happened to my message.

I have the pot you need. The pot's in excellent condition and I thoroughly checked the pot after cleaning it with DeoXit D5, no erratic behavior or loss of resistance throughout the pot's rotation. It comes with new .001ufd disc capacitor and both mounting hardware (washer and nut).

Replacing the pots requires removing the front panel. You will need the 530 service manual. Simply click on the following link to download the service manual.

http://w5rkl.com/wp-content/uploads/2014/04/TS-530S_Service.pdf

Price is $8 shipped to your door. Paypal "w5rkl at yahoo dot com" is okay with me. If interested let me know and I can get the pot in the mail to you tomorrow.

Mitch,

I have a clean MIC gain pot which is the same Kenwood part number, R01-3414-05 10K, that is used as the volume control (verified in the TS-530S service manual page 31).

The pot is in excellent physical and electrical condition. The resistance between the wiper and either end varies in a smooth manner, no erratic or loss of resistance throughout the pots range (measured with my Heathkit IM-5225 FET volt/ohm meter).

The pot comes with mounting washer and nut. The wires to the pot have been cut leaving about 2 inches of shielded wire remaining. I am including a new .001ufd disc capacitor, connects between the pot pins 1 and 3 as shown on the TS-530S schematic.

To remove the volume control pot requires removing the front panel. You will need the TS-530S service manual which I have on my website, click on the following link to download the TS-530S service manual:

http://w5rkl.com/wp-content/uploads/2014/04/TS-530S_Service.pdf

If you are interested let me know, price is $8 shipped to your door. Paypal is okay for me (Paypal address is w5rkl at yahoo dot com).

54446. Sharing single mic with several rigs

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-30 05:19:58 UTC
From: Jeff AC0C
Topic: 54446 Message: 54446

I want to mount a single mic on a boom and then switch it among 2 KW Hybrids (both the 820 and 830 have a Hi-Z mic input) and a Yaesu FT-102 hybrid (low-Z mic input).

What's better from a noise (hum) pickup standpoint – use the hi-z or low-z mic and then transform up/down to the end rig's need?

Some of you long time SSB ops will laugh at this but I just don't know what the right way of handling this sort of mic routing is in the context of a multi-rig setup. So appreciate any advice you may have.

Jeff,

Others can respond to the logistics of single mic/multiple rigs, but one thing I can share is that the pin out for the KW mics is different from the Yaesu mics. Check the manuals, but I wanted to use a second MC-50 with my Yaesu FT-901DM and had to re-wire the plug for it to work. If so, that adds another layer of complication, I guess.

Hi Jeff,

I think you'll find all these radios work with a
Lo-Z mic ~500 ohms. I would use the Lo Z line
every time to reduce susceptibility to hum and
noise and make sure it was transformer isolated.
Take a look at the W2IHY iBox for ideas about how
to make a good MIC isolation box.
http://www.w2ihy.com/ibox.html Couple it with
Mark's switching system and I think you'll have a pretty good setup.

If you can't find a suitable computer switch your
other option could be to feed transformer
isolated MIC audio to all three radios at the
same time and just switch the PTT between rigs.
While you might think that's a little weird just
think about it for a moment and you'll see that
as long as VOX is off on the rigs they won't care
if there's MIC audio or not until they get PTT.
It works and significantly simplifies your wiring.

Regards

Lou

Dave,

I should have explained more fully. Sorry for the confusion. I'm not expecting to use the mic without something between the mic and the rig.

My first thought of a solution is to do it like this:

600 ohm MIC–>RELAY–>TRANSFORMER–>50K rig 1 mic input
RELAY–>TRANSFORMER–>50K rig 2 mic input
RELAY–>600 ohm rig 3 mic input

But I don't know if that is a recipe for hum pickup as the relay would share the common grounds on all mics. And maybe it's better to use the hi-z 50K mic for distribution, instead of using the 600-ohm.

Another way to do it would be to use DPDT relays and switch both sides of the mic so that the rigs remain isolated (no common mic ground would be shared) from mic all the way to rig.

And would you use twisted pair or conventional shielded wire (one pair inside the shield for the mic + shield ground).

I can figure this out experimentally by trial and error - but thought someone else would have been there, done that before and the lessons would have been learned. This looks like one of those projects that looks a lot simpler than it really is.

Jeff,

Others can respond to the logistics of single mic/multiple rigs, but one thing I can share is that the pin out for the KW mics is different from the Yaesu mics. Check the manuals, but I wanted to use a second MC-50 with my Yaesu FT-901DM and had to re-wire the plug for it to work. If so, that adds another layer of complication, I guess.

Subject: [TS-520_820_530_830] Sharing single mic with several rigs

I want to mount a single mic on a boom and then switch it among 2 KW Hybrids (both the 820 and 830 have a Hi-Z mic input) and a Yaesu FT-102 hybrid (low-Z mic input).

What's better from a noise (hum) pickup standpoint – use the hi-z or low-z mic and then transform up/down to the end rig's need?

Some of you long time SSB ops will laugh at this but I just don't know what the right way of handling this sort of mic routing is in the context of a multi-rig setup. So appreciate any advice you may have.

Jeff,

What I used was shielded audio cable. The type that you can purchase just about anywhere with RCA connectors on each end. I used either a single cable or double shielded cable. Mic Audio through one cable, ptt through another, speaker through another, etc. etc. I have the following radio's that work through the same box(s) and use the same mic, either a D-104 or MC-50.

The common microphone input to the box I use a female 1/4 inch stereo jack. If I want to plug in a different mic, I just unplug one and plug in another. I do the same thing for all of the radio's. They all have a 12 inch cable with the appropriate mic plug and female 1/4 inch stereo jack on the other end. So all of the cables from the AB box come out an RS-232 jack on the rear of the box, through an appropriate length of cable to a mail 1/4 inch male stereo jack.

Single ABCD Box #1: (All of these share a common Drake L-4B, and a D-104)

Drake TR-7
Drake 'C' line
Drake TR-4CW
Kenwood TS-130V

Dual ABCD Box #2&3: (All of these share a common MC-50 mic and a Drake L-4B)

Kenwood TS-830
Kenwood TS-520S
Swan 700CX
Swan 400
Heathkit SB-101
Heathkit SB-102

The TS-830 has a range of microphone impedance values from 500 ohms to 50K ohms. Therefore a microphone with impedance values within that range will work with the TS-830 without any modifications to the radio or microphone.

You can read the TS-830S specifications on page 3 of the TS-830S User manual.

If you do not have the TS-830S user manual, you can download it at the following link:

I forgot to comment about the MC50. The MC50 has 2 impedance ranges depending on how the microphone to base cable is plugged into the rear of the microphone.

600 ohms +/- 30% at 1Khz
50K ohms +/- 30% at 1Khz

You can read about this by clicking on the following link:

Hi Bob,

Check if the MC-50 mic is set to low impedance. If so, try setting it to high and see if that helps.

Hi Jeff,

I wouldn't tie the MIC grounds of your rigs
together as you may introduce hum. Better to
switch the ground and hot to each radio.

54461. TS-520 intermittent receive

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-03-30 21:55:41 UTC

Topic: 54461 Message: 54461

Hi guys

I have a big problem. This started few days ago. I had few areas on VFO that had intermittent receiving when tuned to that areas. Yesterday I couldn't tune to any frequency. All of them were intermittent. I took VFO out and cleaned that contact on the back of the variable capacitor. I cleaned it with alcohol and for few hours all was good. This morning everything was fine, tonight it's worse than ever. I hear people talking, but it's so intermittent that I can't understand anything.

I don't know how much a new VFO costs as that would probably be the best thing to do.

Should I put some kind of conducting grease between the contacts? I can't believe that the variable capacitor relies on that sliding contact... Could I solder a short piece of wire directly to the last capacitor plate?

Should I replace the variable capacitor inside the VFO?

I am not sure what to do now, especially since I want to avoid tinkering with the radio too much. Solder joints are all very old and they unsolder with just a little bit of force.

Mario, 9A3DLZ

Mario,

The VFO variable capacitor has 2 flexible sliding shaft to frame connections, one on each end of the capacitor shaft.

If these connections become "intermittent", the VFO oscillator can and quite often will become erratic causing intermittent receive at various points throughout the VFO tuning.

Depending on how dirty the variable capacitor shaft to frame connections are, it may require more than one cleaning.

I used DeoXit D5 contact cleaner applied to the VFO variable capacitor shaft using a cotton swab. The following link is to a video I made that shows how to do this. The VFO (LMO) and variable capacitors shown in the video are not Kenwood but the process is the same for Kenwood hybrid VFO variable capacitor cleaning.

http://w5rkl.com/wp-content/uploads/2015/02/Cleaning-Variable-Capacitor-Flexible-Shaft-to-Frame-connection.wmv http://w5rkl.com/wp-content/uploads/2015/02/Cleaning-Variable-Capacitor-Flexible-Shaft-to-Frame-connection.wmv

I also use DeoXit L260Ap conductive grease that is applied to the bearing end of the VFO variable capacitor after a thorough D5 cleaning of the VFO shaft to frame connection.

I am in the process of making a new video that shows how to do the same thing with Kenwood VFOs but I'm adding sections that show how to power the VFO outside of the KW hybrid from a small 9VDC regulated supply, how to connect a scope and frequency counter to the VFO output, and monitor the VFO, after cleaning, to ensure the VFO tuning is no longer erratic throughout its tuning range. I'm having problems finding video recording software that allows pausing the video recording. So far I haven't found any that doesn't cost an arm and a leg..

Terry;

Thanks for all the advice.

After following all the recommended procedures, getting more and more
desperate since everything worked -- but didn't I went ahead, pulled Q4,
installed a socket and started to try different 2SK19 (Y) in place of
the one I had installed.
The third one made a big difference! I could ALMOST adjust Zero and S9.
The fifth allowed proper adjustment with some range left on both "Zero"
and "S".

So much for the old Japanese transistor grading system!!!!!BTW: These
came from 2 different HK suppliers; both very reliable.

Need to work on an Icom PW1 tomorrow.

Time for my evening Scotch, Neat, No Ice <g>.

Thanks again.

You might try re soldering them . old solder will sometimes crystalize and although it looks good on the outside there is no or an intermittent connection inside . have fixed many difficult to find problems in that way .

Bob,

You can check the microphone preamp, Q19 on the IF Unit, by using a scope set to measure AC, the input to a low level, and the probe connected to the MIC gain pot's wiper (center terminal) and the probe's ground to the 830's chassis.

Connect the microphone to the 830, set the MODE switch to either USB or LSB, connect the 830 to a 50 ohm dummy load, then set the MIC gain to 12 o'clock and speak into the microphone at a normal voice level. You can whistle into the microphone instead but keep the whistle at a low level. If Q19 is not bad then you should see a rather high signal level displayed on the scope. If the scope trace goes off the top and bottom of the scope, increase the input signal level control on the scope so the trace drops down and displays properly on the scope.

I've used an audio tone in place of speaking or whistling into a microphone. The audio tone can be from a CW keyer set to produce a steady audio tone. I use my MFJ-407D keyer with the "TUNE" button pressed which produces a steady tone in the keyer's speaker. Place the microphone close to but not directly at the keyer's speaker. If Q19 is good you should see the keyer's audio tone "sine wave" displayed on the scope. I've also tested microphone elements this way except I connect the scope to the microphone element.

You can see the microphone audio signal path by studying the TS-830 high resolution schematic available on my website:

http://w5rkl.com/wp-content/uploads/2014/04/TS-830S-excellent-schematic.pdf

The microphone MIC socket, MIC gain pot, and the wiring can be found to the left of the Rectifier Unit on the schematic. Q19 is the microphone preamp and if it's bad then very little, if any, microphone audio will get through to Q20 and Q21.

The TS520 has ONE rotor shaft wiper contact on the outboard end of the air variable accesible thru the removable cover on side of shield can. The TS530/830 has two wiper contacts one at outboard end and one at the inboard in.

There is no reason to apply conductive grease to the ball and race. I certainly would not make it routine practice. A good way for an inexperienced person to have this migrate to the PC board and present a real problem. Not everyone has good mechanical skills. The ball and race was never intended to be a path for RF current so no reason to try to make it a path. Unless perhaps the wiper has been damaged by someone attempting to bend it to improve contact and replacement is unavailable and only way to salvage the air variable capacitor would be to use conductive grease in the ball and race.

Capacitor manufacturers worked hard to make a good consistent low resistance RF path from the rotor shaft to the capacitor frame. The evolution included soldering a braided conductor to the outboard end of the shaft. This was abandoned as it introduces drag and back lash. Next they mounted carbon brushes.This wasnt good as the brush would wear and had to be tensioned with a spring and over time it produced conductive carbon dust. Eventually they settled on the use of machining a flat on end of the rotor shaft and mounting the spring temper forked contacts we see today (usually made from beryllium copper which may be nickle plated depending on RF currents involved). The old Cardwell engineering catalogs of the 30s and 40s show the evolution of the air variable and they in fact use to sell a small tube of conductive grease before they developed the wiper contact which eliminated the need for RF current path thru the ball bearings and the race.

If no regulated 9vdc supply can easily temporarily power VFO with a 9vdc transistor radio battery. TS530/830 VFOs pull from 40ma to 60ma and a fresh 9vdc battery has approx 500mahr capacity. All of the VFOs have low current draw.

The real reason to remove the TS520 VFO is not to clean the bearing and race or to clean the wiper contact. The hard grease problem is a myth. If your TS520 VFO is "stiff" it has very little to do with the air variable ball and race. The reduction that the gear train presents wouldnt let you see or feel "hard" grease in the air variable capacitor. There are two opportunities for improvement that you dont want to squander if you go to the trouble of pulling the VFO.
1. Disassemble the "jackson drive" on the input shaft. This is much more likely where the hard dryed grease is at that has introduced stiffness in rotation. Remove the ball bearings and clean the bearings and race and re-lube. I like to use Magnalube G or Superlube with Syncolon (PTFE). Be careful that you do not disengage the anti-back lash gears or at least pay attention to how many teeth are offset to give proper tension. Easy to over look this when moving the VFO knob shaft axially to remove the 3 large ball bearings in the race and the 1 smaller ball bearing down inside at the end of the shaft. If you do disengage the pinion you will have to reset the pre-load when re-assembling. Make sure you remove all the old dryed out grease. May take a strong solvent like lacquer thinner or carb cleaner like Gumout.
2. If the Tank coil brass lead screw still has its two ears on the adjustment slot then remove the heavy coating of "tan colored" thread sealant and back out the lead screw. There

isnt any good solvent to dissolve this sealant. Best is to apply heat from high wattage soldering iron or solder gun to the lead screw and top of the tank coil former (where mating female threads are at) to soften this stuff and back out the lead screw and then wire brush off all the sealant from the threads. About 90% of the TS520 VFOs I see have one ear broken off and no way to align the VFO. Not possible to remove this sealant with VFO in place and working thru the small adjustment hole in the shield can.

The You Tube video that was recently cited on this forum showing TS520 VFO removal and service was a bad example for a lot of reasons including these two important steps which this chap didnt do. Likely didnt recognize the "jackson drive" or understand its purpose and he simply cant be doing an alignment which requires turning the L1 Tank coil lead screw which drives the ferrite core.

Lastly, do not use motor oil or 3-n-1 to lube the gear train as the fellow suggested. It will just drip off and make a mess in the radio and run out on to the bottom of the front panel bezel and maybe drip on your operating position. Best to use a PTFE based lubricant like Tri-Flow and apply light coat to the pinions and anti-backlash gears. Any dry film lubricant is better than oil. I apply a very light coat of Tri-flow using a small tipped artist paint brush. It takes very little to get a silky smooth running VFO.

Have to be careful with You Tube videos and applying them to your KW hybrids. Like everything on the internet you can find 3 basic categories being promoted. Hamfisted or back yard work, good enough work, and work that is best practice. Before doing what you see like what was shown on this recent TS520 VFO refurb it is best if you come to this forum and ask what members think about the video.

In my opinion there is a need for good quality videos and it takes time and work to make a quality instructional video. It is good we have members willing to take on this important task. Video is a step up from just telling. Much better when you can also show. The training model is Tell, Show, Let Practice, Observe and Coach. Best we can do here is Tell. Maybe someday for those who dont have a website it will also be easier to also Show.

I should have mentioned that most air variable capacitor rotor shaft wiper contacts are made of phosphor bronze which has self lubricating qualities. Will see the beryllium copper wipers more commonly in high power transmitter tank circuits where higher RF currents are involved. I dont know, but suspect the wipers in our KW hybrid air variables are made of phosphor bronze.

Important thing is dont try to bend them. I apply small amount of Deoxit D5 with artist brush and exercise thru complete rotational travel and blow out with canned air. May have to repeat process. In stubborn cases may have to use a drop of full strength D100L and then finish with D5 and again blow out to flush contaminants.

I see a lot of discussion about spraying contact cleaner and I very seldom have to use the spray nozzle for application on any of the pots, switches or trimmers. Very hard to control amount released with the spray nozzle. I transfer by spraying into a small wide mouth pill bottle and apply using artist brushes. I have small air compressor under the bench, but also keep a few cans of canned air on hand.

Bob,
Locate the PROC (processor) switch at the upper left. Push it in and see if you can get normal ALC levels with the processor on. If you can, push the processor switch in and out a dozen times or so. If you now have normal level of mic gain, the switch needs to be cleaned with some DeOxit cleaner.

Mark,

While Mike (W5RKL) provided an excellent approach to the Bob's problem if internal surgery is needed, it occurs to me that your 'external solution' is a great first step.....and thus I wondered if there 'Other' similar external things that us Hybrid users can do as annual preventive mx procedures to keep our machines running longer before internal surgery is required.

If you have, or can build such a list for us, it would be greatly appreciated,

Thanks in advance,

73s,

Dave

I will open it again today and resolder all joints. Also I will record how it sounds and upload it so you can hear it yourself.

I will try to clean it with the products that I have. If I order something from amazon or ebay, it takes 3 weeks for it to arrive.

Hi Mark:

This is getting to be a real problem.

These miniature pushbutton switches are essentially sealed units and hard to introduce any meaningful amount of contact cleaner into the contact area. It is more like hoping that some will migrate there. Sometimes where they fold the switch body metal over there will be a very small hole in a corner where you can press and hold the D5 nozzle and inject some cleaner inside.

As I remove all front panels to clean them and the knobs I turn the radio over and let it rest on the fan housing and secure and balance it so it wont fall over and I apply D5 at all of the push button actuators and let gravity do its job and then exercise switch multiple times as you state. Often have to repeat process a couple times. FIX switch, RF attenuator and just about all will be noisy or just flat wont work.

Sometimes the intermittent effect is most pronounced if you grasp the grey rectangular button and move it gently side to side rather than in and out.

I wish there was a source of exact fit and form replacement miniature push button switches.

I have a parts TS830 on the way and I am going to remove the Processor push button switch and try to very carefully drill a little larger hole in back corner. Before I do that I may bend the four locking tabs over and disassemble the switch to see how much clearance there is and if a better way to make a injection port. Just afraid will break off one or more of the tabs in the bending operation.

It would be best if could enlarge the existing hole with switch in place so not have to remove the miniature coax solder connections. I dont like drilling in the radio. Have to have help applying shop vac and maybe some wetted paper towels below to catch and remove all conductive shavings. Just not a good thing to do.

I have talked to several people about this and no one has offered a good solution. If I am successful in restoring normal function by contact cleaner application I have to tell my customers I cannot guarantee it will be a very long lived "fix".

The processor push button has been a problem that I've noticed running the Hybrid net in maybe a dozen cases so far. As far as I know, fixing the button has fixed the low audio in all cases. I know that I had the same problem with two 830's that I've owned.

What I did is what you explained where I had to pry the corner apart a bit, and spray Deoxit inside. The one remaining 830 that I have and is used every Saturday for the net is still working after using that procedure over 2 years ago. As I recall I put the radio on it's back, so the rear was sitting on the desk and the front panel was parallel to the desk top. I wanted to have the Deoxit wick down to the bottom of the switch. I did not see any way of removing the switch cover without removing the front panel, which I wanted to save as a last resort.

So right now I'm in the Don't fix it if it's not broken mode, with the switch still working and my mic level fixed.

Mark

Dave,

If your going to Dayton this year, that's one of the subjects that will be presented. Not a complete list, but maybe just 4 or 5 items to be quickly reviewed.

If anyone has other simple fixes, I would enjoy seeing them for possible addition into the forum presentation.

Most of these fixes/procedures are already documented on my Hybrid Net web site, so the presentation will just be a quick review to let everyone know what's out there.

Of course, I'll post the full presentation on my web site after the Dayton Hamvention forum with the other's for people not able to attend. http://wb4hfn.com/KENWOOD/Hamvention_Forums.htm .

Fantastic Mark,

Thanks....and I am a great believer in 'If it aint broke dont fix it.'

However, the experts on this Group do present excellent, useful advice to keep our treasures well oiled and in tune.

Fortunately, as 2nd owner of 530 and 830, no issues with either one.

Hoping to make Dayton,

73s,

Dave

Dave:

From response 54343 I provided this:

"Also, I dont remember if you subed Q4 and Q5 out? If so, that can be a problem. Circuit is fussy as to the FET. A 2SK192A is very often found in the meter FET position instead of the 2SK19."

Makes you wonder why KW used the 2SK192A in lieu of the 2SK19 in many of the Hybrids? Perhaps they experienced quality issues. I think original supplier was Toshiba, but not certain. I know I have tried a MPF-102 and NTE sub and they didnt work. I have had best luck with the 2SK192A harvested from a parts rig.

We knew that after you set RF-1 spot on and then measured the AGC bus with your 10 gig input Z DMM you found it lower than where you had set RF-1 so there was something hanging on the buss and pulling it down. Normal failure of the meter FET is to short and when that happens the S meter will peg and receiver shut down. I have never seen the Gate of a functioning 2SK19 device present a low enough impedance to load the bus down. I will tuck this away in my memory bank.

Thanks for the closure.

Terry;

Thanks for all the advice.

After following all the recommended procedures, getting more and more desperate since everything worked -- but didn't I went ahead, pulled Q4, installed a socket and started to try different 2SK19 (Y) in place of the one I had installed.
The third one made a big difference! I could ALMOST adjust Zero and S9. The fifth allowed proper adjustment with some range left on both "Zero" and "S".

So much for the old Japanese transistor grading system!!!!!BTW: These came from 2 different HK suppliers; both very reliable.

Need to work on an Icom PW1 tomorrow.

Time for my evening Scotch, Neat, No Ice <g>.

Thanks again.

No reason to set RF-1 to exactly 3.5vdc. Can be set at 3.3 or 3.4. That isnt the problem.

The problem is that whatever dc control voltage level that you set RF-1 to you will have a standing S meter indication.

You see the reason for the standing S meter indication when you measure the AGC bus and find that it is 0.3vdc or so lower than RF-1. RF-1 is a low Z supply. It feeds the AGC buss thru a 2.2 meg series resistor making the buss a very high impedance power supply. It is not designed to supply current. Only control or servo voltage to Gate 2 of the gain controlled devices.

Topic: 54481 Message: 54481

Welcome to the Yahoo Kenwood TS-520_820_530_830 Amateur Radio Group. This group is comprised of members who's interest is in maintaining and operating the Kenwood TS-520, TS-820, TS-530, TS-830, TS-510, TS-511, T-599/R599 and R820 Hybrid transceivers, transmitter and receivers. In addition, the group supports discussions covering the associated Kenwood accessories such as the VFO-520, VFO-820, VFO-230, and VFO-240 remote VFOs, the Kenwood antenna tuners, and the various Kenwood desk and hand microphones.

This is a restricted group requiring membership approval prior to receiving and posting messages to the group. To join the group simply complete the Yahoo Kenwood TS-520_820_530_830 Group's application process by clicking on the “+ Join Group” icon on the group's homepage. Select the desired method of receiving messages by clicking the appropriate radio button, then provide a brief description about yourself to include: your first name, your Amateur Radio call sign, your interest in the Kenwood hybrid radio, and the model of Kenwood hybrid you own, operate, or in the process of purchasing in the text box provided. If you are not a licensed Amateur Radio operator, no problem, simply complete the application process and provide the same information less the Amateur Radio call sign. Once you have completed the text, click the Join Group icon. Your application will be reviewed and approved by a group co-owner or Moderator. If you leave the application text box blank, your application for membership will be rejected. Simply reapply and provide the information requested and resubmit your application for membership.

New members are placed on a "Moderate" status. This means that any message a new member posts to the group must be approved by a group co-owner or Moderator before it appears on the group server for all members to see. The length of time a new member remains in a "Moderate message status" is determined by the members ability to adhere to, and follow the group's policies. The faster the new member(s) can prove they are adhering to, and following the group's policies, the quicker the new member's status will be changed to “Allowed”.

The “Allowed” status means the member can submit/post their messages without group co-owner or Moderator's approval. A member who's message status is set to “Allowed” may have their message status changed to "Moderate" if it is deemed necessary by a group co-owner or Moderator for one of the following reasons:

1. Failure to follow the group's policies after being informed by a group co-owner or Moderator
2. Knowingly violate any of the group's policies
3. Any improper behavior by the member that is deemed inappropriate by a group co-owner or Moderator

The group is moderated by both group co-owners and group Moderators. While we would like to have a group co-owner and/or Moderator present 24/7, that is not possible, as group co-owners and Moderators have a life too. Therefore, there will be times when a group co-owner and/or a moderator will not be present. This will affect the time a moderated member's messages may take to get approved/rejected. This occurs most often during major holidays Also, the group's server is not maintained by the group co-owner(s) or Moderators.

Therefore, when Yahoo has problems affecting Yahoo Groups, ALL members will simply have to wait for Yahoo to fix the problem. Group co-owners and Moderators also do not have any control over how the group's server handles attachments to messages or how message search results are provided.

Page 1

As stated above, this group has a set of policies that all members must agree to and abide by. If any member, new or old, that feels they cannot accept the group's policies, that member is free to terminate their membership at any time without notifying the group co-owners and/or Moderators.

Group's Policies:

1. Profanity of any type, regardless of the word and/or phrase(s) used in a message, is not allowed. This includes the use of abbreviation to improper words, use of symbols to substitute for letters, etc. In short, the use of profanity is NOT ALLOWED, PERIOD!!! The quickest way to get banned from this group is to use profanity!!!

2. Disrespect/Flaming any member regardless of the reason, is not allowed.

3. Taking over a thread by a member that changes the threads original subject and content, is not allowed.

4. Messages that contain as part of the message text, discussions of a member's private life are not allowed. Responses to messages are to pertain to the original message subject.

5. Long discussions that are products of an original messages are not allowed. If there are 2 or 3 members who wish to discuss a subject in more detail and at great lengths should take their discussions off the group and continue their discussions using private email addresses.

6. MESSAGES THAT DO NOT CONTAIN ACCEPTABLE MESSAGE SIGNATURES, WILL BE SUMMARILY REJECTED! It takes less than 5 seconds to ensure your message contains an acceptable message signature. There is no excuse for not adding a message signature to your messages. Political or religious signatures/statements are not permitted.

The following are examples of the ONLY acceptable message signatures:

Licensed Amateur Radio members:

Example:
“73s
John WA1ABC”

Non-licensed members

Example:

73s
Mary

If a member does not wish to include their Amateur Radio call sign in their signature, then simply use their first/given/Christian name ONLY, same as non-licensed members.

Each message signature must be positioned at the bottom of the message text and separated by at least one line.

For example:

Hi John,

Yes capacitor C25 is the right cap you should be checking. For details, review the schematic.

73s
Bill

Screen names such as JLH524 or MWPO125 are not acceptable message signatures. Screen names are acceptable ONLY when used as part of the member's email address.

The member's email address is not an acceptable message signature, regardless whether the member's name appears in the email address or not.

A member's “initials” are not acceptable as a messages signature.

A member may add up to 2 additional lines to their message signature. The additional 2 lines may contain a link to the member's website and a link to the member's Amateur Radio club etc. The addition of 3 or more lines to the message signature, listing the many different clubs the member belongs to, the positions they hold within the respective club(s), their professional position within the company the member works for, and other information is considered excessive and not allowed. The following is an example of an acceptable message signature containing two additional line:

73
Mike-w5rkl
www.w5rkl.com
Yahoo Kenwood TS-520_820_530_830 Moderator (Mike-w5rkl is no longer a Moderator, but used as an example--tnx)

In the past there have been members who state our group policies are too strict. We maintain strict group policies for 2 simple reasons:

1. To maintain good order and discipline in the group.
2. Provide a friendly group where all members are treated equally and an environment free of improper behavior

73
Yahoo Kenwood TS-520_820_530_830 Hybrid Group Co-owners and Moderators.

When I have run into these "sealed" switches, I have taken a hand drill arbor (not sure what to call it) with a small bit & slowly drill a hole in what I believe to be a inconsequential area of the switch. Sometimes you can see teh actuation of the switch & it can give you an idea where it is safe to drill. After spraying my fav cleaner, I actuate the switch & wipe the area off & apply a piece of tape to seal the hole. - Bob

Yes I have a Pin Vise and Number and Letter drill sets. Still dont like drilling either by hand or power with the device in the radio and dont like drilling blindly into a device. I dont have a drill stop that would fit the small diameter bits involved here. Of course with Pin vise and hand drilling have better control of how far you penetrate into the assumed "void".

Also sometimes there is no small pilot hole in the folded corner crease making it harder to enlarge an existing opening. Much easier to enlarge a pilot hole than drilling a fresh hole.

Also not possible to hand or power drill in the majority of the 10 mini-pushbutton switches on an 830 due to physical obstructions. The RF processor one is mounted with no obstructions and you can get a clear shot at it.

I do the same contact cleaner injection method with the VFO and Transverter mini-Din switches which have folded over bodies and fortunately typically an accessible small access hole in the crease of a corner fold.

I am going to pull an RF processor switch and try to bend the 4 small retaining arms over and remove switch slide and contacts and see how much room is in the corner "void" and then try to bend the metal arms back without breaking them off.

Thanks
Terry K9TW

Terry
easiest way I have found to straighten the tabs is to use a pair of precision cutters since the blade is thin enough to slip under the tab .I tried a pocket knife blade and it was too wide and a miniature screwdriver blade was too thick . just be careful not to cut the tabs off .

The following TS-520_820_530_830 poll is now closed. Here are the
final results

should items advertised as "FOR SALE" to the group, be limited to Kenwood hybrid rigs and/or parts?

Joe:

Thanks-- I especially like that they are bendable. Will still use Walmart artist brushes for application of contact cleaner to pots and air variables, but for cleaning rotary deck switches these look like will work nicely.

I had been taking a brush and flattening it down so it is no longer pointed, but more like a mini car wash brush wheel and I twirl it between fingers to clean the contacts between the very close spaced vertical BS boards on the 530 and 830 and on the S22 switch inside the PA cage. Have to be very careful not to snag or bend any contact fingers. Maybe I can use these for application and continue to use the artist brush for cleaning? Certainly will give them a try.

Joe

Understand the vote is in, but wish we could consider allowing basic test gear like VTVM, RF sig gens, RF probes, Freq Counters.

Many of the new Hybrid owners who come hear for help need basic test gear.

As I have upgraded my bench over the years I have sold most of these pieces of test gear to members rather than listing on Ebay.

Just a thought for perhaps another time.

54490. Noise on TS-830s

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-02 20:06:28 UTC
From: zehrhj@...
Topic: 54490 Message: 54490

I recently installed the endfed antenna reviewed in the March QST. It matches nicely without a tuner, as advertised, and works fine on my TS-180s and on my TS-520SE. But on the TS-830s, I have such a high noise level that the rig is unusable. It almost sounds like splatter from a nearby signal. I can get rid of it two ways: by inserting a AT-200 manual tuner and tuning the antenna, or by using my Timewave ANC-4 noise nuller. Even stranger, my LDG auto tuner does not remove the noise.

The fact that the ANC-4 takes it out suggests that it is a common mode current problem. But why only with the TS-830s? I've tried disconnecting everything from the TS-830 (key, station monitor, etc). I've also tried connecting the antenna directly to the TS-830s, by passing antenna switches, tuners, SWR meter. The noise is still there.

I've tried disconnecting the ground wire and also using a different ground. No help.

The TS-830s is grounded by a strap that runs to the nearby AT-200, and there from ground.

I have a common mode choke on the antenna lead, by the way.

I asked on the Kenwood hybrid net and no one there had suggestions.

I'd appreciate any suggestions

Terry,
 I agree. The main reason behind the poll was because several new members came into the group for the sole purpose of selling non-Kenwood items(yeasu and icom rigs in particular), and after reviewing several other sites, QRZ in particular, it was found to be a total scam attempt and they were banned from the group. I have no problem with items that can be used for servicing/repair of our KW hybrids. You might be surprised how many new members join for the sole purpose of "data mining" and spam/scam attempts. I still have "moderated" members complaining about; why does it take so long for my message to show up...or why it does not show up...when you point out the simple fact that they failed to read the group policy/rules that were automatically sent to them...then it's...."well...the other group(s) I belong to..don't do it that way."
   I think that some change of wording may be in order to allow..."service items" to be part of the "for sale" list.
  thanks for your input,
   73,
     Joe wb7uqu

Terry,
  I ran upon these by accident...a catalog came in the mail. As I stated, I've been using these for sometime...they will hold enough cleaner, and are soft enough to use a light scrubbing action on some of the more hard to get at switch wafers and don't seem to shed the bristles or bits of cotton like a swab .....and if you run out of dental floss..hihi

Greetings group,
  A new poll will be posted shortly. At the request of a long standing member, the new poll deals with being able to list "for sale" service items(vtvm's,freq counters/Rf generators..etc) that can be used to service our KW hybrids. The prior poll restricted the "for sale" to Kenwood or closely associated items only. That policy will still be in force, as far as rigs go...and other restrictions still apply, which is mainly put on new/moderated members to keep out the spam/scam. The group administration tries to practice due diligence to keep out the unsavory..but every once in a while one gets through, and when found out..they are banned. The poll with run for 7 days.

Do you have the TS-830 Noise Limiter turned ON? If you so try turning
the Noise Limiter OFF to see if the "splatter" signal disappears.

I have a TS-520S, a Heathkit SB-303 with a TS-520 Noise limiter
installed, and a Yeasu FT-757GX and they all produce what appears to be
splatter when the noise limiters are turned ON to eliminate pulse type
noise. Turning the Noise Limiters OFF and the "splatter" signal disappears.

Topic: 54496 Message: 54497

I would connect the W3YY FSK interface to the 820's rear panel FSK socket and the interface PTT to the 820's PTT then set the 820 Mode switch to FSK. The W3YY "keys" the TS-820 FSK socket just like an older TU (Terminal Unit) relay does except the W3YY uses ICs to do the job of a relay.. It's quite simple actually, just be sure when you connect the W3YY FSK keyer circuit to the TS-820 FSK socket that in transmit the TS-820, with no FSK keying, transmits a "Mark" signal which is 2125Hz. The Space is 2295Hz. The Mark and Space produce 170hz shift (2295 = 2125 = 170). Last, connect the W3YY FSK keying circuit to your computer as shown in the W3YY manual.

I recommend reading page 23 paragraph 4.19 "FSK OPERATION" in the TS-820 user manual.

The TS-820 FSK mode has 2 shift options

Wide 870Hz
Narrow 170Hz

page 23, Fig 11, shows how to set the 820's FSK shift to either Narrow or Wide. Most amateur RTTY operates Narrow 170hz shift.

Also note that the FSK mode in the 820 "reduces" input power which may "fool" you if you don't pay attention to that statement in the use manual, making you believe there is something wrong with your 820.

I operated a lot of RTTY back in the early 80s. I used a Hallicrafters HT-32 with a modified VFO using diode switching FSK were a simple diode switch controlled by a D cell battery in series with the Teletype KSR keyboard contacts switched a capacitor in and out of the VFO circuit producing 170hz shift of the CW RF carrier. I also used a Flesher TU-170 (Terminal Unit, came as a kit), a Mactronics 1 bit serial interface with a Radio Shack TRS-80 Model 1 and my own home made Z80 machine language RTTY 60/100 wpm 5 bit baudot and 7 bit ASCII software I wrote for the TRS-80 Model 1.. That was a lot of fun as RTTY was very popular back then.

Topic: 54490 Message: 54501

Yes, I have been in contact with him, and he has been very helpful. Here is his latest reply:

I have searched for a schematic of Kenwood AT-200 Tuner and looks like they have also series capacitor too with an inductor and it acts as a bandpass filter or preselector. That is very good on RX.
LDG tuners are mostly LC network and it changes the only position of C before and after the L for High/Low Z matching, like a Z-11 model. That is the simplest way of matching and its ability to act as low pass filter is very limited.

TS-830 has preselector too and if you were testing with that radio it is obvious that front end is overloaded by some source which induces the noise directly to the antenna and shield of the cable. CMC on coax can’t help with signals/noise induced into antenna wire and carried directly to the receiver. It is obvious that AT-200 isolate the wideband noise by acting as a bandpass filter.

I would look for obvious sources of noise, check every band and try to turn off some appliances, power supplies, laptop supplies, network and cable modems etc.

And to respond to the earlier post, the Noise Blanker isn't on but doesn't seem to make a difference either way.

54504. Hybrid Net Update (April 2, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-03 21:18:46 UTC
From: Mark Gilger
Topic: 54504 Message: 54504

Dayton Hamvention Forum:

There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by Jimmy, WB2KNR, with me
taking over at the very end.Â There were 27
stations checking in under good conditions.Â
Â There was 3 new station checking in, Â KA2DAS, W8JWE, and WD8T.

We had the following number of radios checking in.

4 running TS-520(x)

3 running TS-530(x)

3 running TS-820(x)

7 running TS-830S

0 running TS-510

0 running TS-511

2 running 599 twins

0 running TS-900Â

I was running my TS-830S and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK.Â There
were 5 stations checking in under poor
conditions. Â Â There was a contest that was
causing lots of problems, plus the band
conditions were very bad. There were no new stations checking in today.

We had the following number of radios checking in.

1 running TS-520(x)

1 Â running TS-530(x)

0 running TS-820(x)

1 running TS-830S

0 running TS-510

0 running TS-511

0 running 599 twins

0 running TS-900

He was running his TS-520 + Heathkit SB-200 amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940â□□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012Â Saturday total 754
check-ins, Sunday tootal 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 cheeck-ins, Sunday total 669 check-ins

November 2015, Saturdays net total = 66, Sundays total = 46

December 2015, Saturdays net total = 55, Sundays total = 73

January 2016, Saturdays net total = 129, Sundays total = 81

February 2016, Saturdays net total = 98, Sundays total = 72

March 2016, Saturdays net total = 74, Sundays total = 35

Topic: 54490 Message: 54505

I may have found the problem. Years ago I had added a receive antenna option, connecting to one of the phone plugs on the back with coax. Based on a user mod suggestion to prevent static damage, I had also added two back to back 1N914 diodes across the phone plug. Today I removed the receive antenna coax and the diodes. So far, I've had none of the noise/splatter problems that were there previously.

My existing plug gets voltage to the pins from the battery in the back of the plug (normally under the hood) but does not make contact with the male pins on the 520? Very strange, no matter how much I wiggle the plug.

I'm looking for the female 12 pin cinch plug or an already made cable. Ken no longer has one on his web site.

From: Nathan Johnson
Topic: 54502 Message: 54508

Kenwood hasn't made their "own" power supply in recent times, they have branded/badged other people's designs. The KPS-15 is a Samlex 1223. I have no experience with the 21, but that *looks* a whole lot like an Astron. Astron was pretty "optimistic" with their current ratings, most companies who rebranded Astrons reduced the current rating. I'd compare that supply to the RS-20A and the RS-35A, both models have manuals and schematics available on repeater-builder.com and other sites.

Attachments: 6 described; binary payloads are missing from this source WARC

The TS-520 and TS-820 12 pin Cinch Jones female power connector part number is:

CINCH JONES S-312-CCT (see following picture):

The same plug with blade clamp is being sold by a California eBay seller for $19.95 FREE SHIPPING on eBay ad #400509628080. You can find the same plug without the side blade clamp for cheaper price but the plug will easily pull off of the rear male connection. I recommend the above female plug with side blade clamps.

To view the above eBay ad simply copy the eBay ad and paste it into the eBay search box then click "Search". The ad will be displayed on your computer screen.

You can also use a 2 wire polarized plug, referred to quite often as "Lamp cord", wired to the above 12 pin connector. Walmart sells polarized plugs in their household electric department (extension cords, power strips etc).

The following picture shows a 2 blade Polarized "Lamp Cord":

Note the size of the blades, one is larger then the other. The "Larger" blade is "AC Neutral" and the wire coating is "Ribbed". The "smaller" blade is "AC Hot" and the wire coating is "Not Ribbed".

The TS-520 and TS-820 12 pin female power connector is wired as shown in the following picture:

2 Jumpers are required as shown in the above picture:

Pins 7 and 10
Pins 8 and 9

You will need zip ties to secure the polarized plug wires to the 12 pin connector's cable clamp since the polarized plug wires are too small for the clamp to hold secure to the connector's hood. You can use zip ties to secure the 2 wires against the plug's clamp. If you are not familiar with what "zip ties" are then the following picture shows what zip ties are. They come in various sizes and colors.

You can use a 3 wire grounded power cable, found at Walmart's TV/Computer department or electrical outlet stores. If you purchase a 3 wire grounded power cable with a 3 blade female end, cut the female end off then strip the cable's outer insulator off exposing 3 wires (see the following picture).

The 3 wires in the above picture are colored:

BLACK (AC Hot)
WHITE (AC Neutral)
GREEN (Safety Ground)

Insert the 3 wire cable through the connector's housing and connect the cable wires to the 12 pin connector as follows:

The GREEN wire connects to pin 1 (Ground)
The BLACK wire connects to pin 6 (AC Hot, connects AC Hot in series with the fuse)
The WHITE wire connects to pin 3 (AC Neutral, connects AC Neutral in series with the front panel Power Switch)

Tighten the 12 pin connector's cable clamp to secure the power cable. If the clamp does not secure the cable, use zip ties to secure the cable against the clamp. You do not want the power cord to pull lose from the 12 pin connector or pull from the 12 pin male connector for any reason!!!

Be careful.

The Hybrid 12 pin power plug is not a Cinch Jones S312.

It is a Japanese JCJ12F and the numbering convention is like a mirrored image of a Cinch Jones.

The only pins in common between them are pins 2, 5, 8, and 11. For example Pin 9 of the Kenwood JCJ is Pin 7 on the Cinch Jones S312.

I use the Cinch Jones S312 but made a pin conversion chart.

I think that Yeasu Fox Tango website has a write up on this trap.

54512. For Sale: Great YG-455C Substitute 500 Hz CW filter – Equal or better!!

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-05 06:24:47 UTC
From: ckepus@...
Topic: 54512 Message: 54512

This message is directed to TS-830S users who like CW and would like an affordable CW filter that makes copying CW a pleasure and is equal or better than the YG-455C.

If the above sentence describes you and / or interests you, please take a look at the article I have uploaded to the Kenwood files section. It is entitled, “Collins 500 Hz filter sub for Kenwood YG-455C filter.”

Spectrum Analyzer and Spectograph plots of this Collins filter done by Terry, K9TW, are included in the article. Terry recently did his amazing magic on my TS-830S. One of my special requests, beyond his normal procedures, was to have him help me by evaluating this filter, and, if it met requirements: easy to install; easy to uninstall; high performance; and works with the Kenwood VBT and IF Shift systems, Terry would install it.
Long story short, Terry installed it and it works like a champ!!

Is there a hitch? Only one. If you are physically able to rotate your IF Shift control from the 12:00 o’clock position to the 9:00 o’clock position when you switch to CW-N, you’re in business. Read the “why” details in the article.

While my main interest was in securing a great filter for my TS-830S, I decided to buy extras since I could always find good use for a 455 kHz IF filter. If, after reading the article, you are interested in getting your hands on one or more of these amazing filters, please contact me off list. They are available for $75 each shipped until gone. PayPal, Postal MO, Personal Check – delayed ship until clears.
Questions welcome.
73 and thanks for the read.

Here is where you can read about the Cinch Jones vs Japanese power plug problem.

I knew about this from my days of servicing the Yaesu FT-101 series rigs and seeing the damage that was done by mistaking the Cinch Jones terminal convention as equivalent to the Japanese plug that Yaesu and KW both used. This mistake can give a whole new meaning to the "max smoke" crowd!

Scroll down this page until you come to the Cinch Jones topic.

These are great for so many uses: they fit inside the tube pin sockets on many miniature tube sockets; use to apply Deoxit, contact cleaner, oil, grease, paint, etc. One of my favorite uses is to use them to apply just a smidge of Rubyfluid soldering paste to assist in getting a perfect solder joint on older gear terminal strips, tube socket pins, etc. Search for microbrush on Amazon. Get 400 for $13. :-)

Hello,

I have a TS820S, great radio. Was working faultlessly up until I moved it to install a newly purchased SP820.

No big deal I thought.

Since then, after warming up, the VFO digital display goes crazy.

It jumps around but doesn't appear to actually affect the received frequency.

Also, the secondary dial (100KHz dial) doesn't move.

Is this a common problem? Is it a simple fix?

Thanks for looking in.

Regards

Mark

From: Mike W5RKL
Topic: 54506 Message: 54518

There are 2 12 pin connectors that are available to use on the
TS-520/520S and TS-820/820S rear male connectors.

The Molex S-3312-CCTL has the clamps mounted on the sides of the plug to
help keep the plug attached to the 520/520S and 820/820S rear 12 pin
male connector.

The Cinch/Jones S-312-CCT plug does not have the clamps mounted on the
side of the plug, therefore the connector can be pulled from the
520/520S or 820/820S rear 12 pin connector rather easily.

The following ebay ads are sources for the S-312-CCT and S-3312-CCTL
female connectors. There are other sources for the S-312-CCT and
S-3312-CCTL connectors, you just have to do your own research to find
the sources.

eBay ad number for S-3312-CCTL female plug
400509628080

eBay ad number for the S-312-CCT female plug
131730451330

I uploaded a video I made that shows how to wire the Cinch/Jones
S-312-CCT or Molex S-3312-CCTL female connectors in accordance with the
TS-520/520S and TS-820/820S schematic diagrams AND the same connector
pin numbers as the original Japanese connector. The S-312-CCT and
S-3312-CCTL female connector terminal numbers are opposite of the
original Japanese connector. Click on the following link to view the video.

http://w5rkl.com/wp-content/uploads/2015/02/Kenwood-12-pin-power-connector-wiring.wmv

A polarized plug with zip wire cable can be found at Walmart in their
Household electric department. The insulation is already stripped on one
end exposing the copper wire. As I state in the video, the polarized
plug has 2 blades, one wider than the other. The wider blade is AC
Neutral and has "ribbed" insulation over the copper wire. The narrow
blade is AC Hot and has a "smooth" insulation over the copper wire.

There is no advantage to using a 3 wire grounded power cable other than
connecting the "GREEN" safety ground to the 12 pin connector's pin "1"
that electrically connects the 520/520S and 820/820S "chassis" to the
wall outlet's "Safety ground" through the house wiring "safety ground"
solid copper wire back to the breaker panel's ground bus.

A few additional devices/ham gear that I am aware of that uses the
cinch/jones or Molex S-3312-CCTL 12 pin power connector are the Drake
AC3/AC4/DC4 AC and DC power supplies as well as the Hallicrafters SR150,

SR160, SR400, SR500, and SR2000 transceiver power supplies. There are, I'm sure, other devices that use the connector.

I just purchased a polarized 2 blade "lamp power cord" from Walmart.
They normally have the "zip cord" (ribbed and smooth insulation) type
polarized cord but today they did not. Instead, Walmart had a polarized
2 blade "round" cord with the ends stripped exposing the 2 wires inside
the insulation. The wires inside the insulation are colored "BLACK" (AC
Hot to narrow blade) and "WHITE" (AC Neutral to wide blade).

You can find the polarized power cord at most hardware stores and
Walmart when they have it.

"Black on Brass Will Save Your *ss."

Easy, quite old mnemonic I learned from my Dad back in the '60's; hard to forget it once you've heard it even one time....

Black (hot) wire goes to the brass-coloured screw terminal (narrow blade, as Mike said) on a plug or outlet. White (neutral) wire goes to the silver-coloured terminal (wide-blade).

Mark,
Do you have the Operating Manual & Service Manual? If not, you can find them at: w5rkl"dot"com (Mike is a group member) or n6wk"dot"com(group member-now SK).
The malfunction of the DG-1 digital display is not uncommon, but I find just the simple act of moving your rig caused the two problems. Just to be clear, when you state that the "secondary dial(100KHz) does not move, are you referring to #7 on Pg #9 of the Operating Manual? The DG-1 and the VFO analog readout are two separate items. The TS-820S will function fine without the DG-1. If you look at the Service Manual Pg 40, the is a short troubleshooting guide for the DG-1. The VFO gear train is a rather interesting engineering marvel, and is usually trouble free, unless a significant trauma is inflicted upon it. The secondary dial is held to a shaft by a single screw. Some further investigation on your part is in order. Removal of the main VFO knob, check for function, remove the plate behind the knob, check for function..etc, etc. I wish I could be more specific, but inspect a bit further, and report back.....

On Saturday, April 9, 2016 10:45 AM, "vk3jma@... [TS-520_820_530_830]" <TS-520_820_530_830@yahoogroups.com> wrote:

  Hello,

I have a TS820S, great radio. Was working faultlessly up until I moved it to install a newly purchased SP820.

No big deal I thought.

Since then, after warming up, the VFO digital display goes crazy.

It jumps around but doesn't appear to actually affect the received frequency.

Also, the secondary dial (100KHz dial) doesn't move.

Is this a common problem? Is it a simple fix?

Thanks for looking in.

Regards

Mark

54522. Hybrid Net Update (April 10, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-10 22:20:42 UTC
From: Mark Gilger
Topic: 54522 Message: 54522

Dayton Hamvention Forum:

There will be a Hybrid forum this year on Saturday May 21, Room #3, @ 1:15PM.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>htm
The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Sunday net was run by Jimmy, WB2KNR, with me
taking over at the very end. There were 14
stations checking in under POOR conditions.

We had the following number of radios checking in.

2 running TS-520(x)
4 running TS-530(x)
0 running TS-820(x)
3 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-830S and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
20 stations checking in under poor conditions.
There were 2 new stations checking in today: KG5DUS, and K4ARD.

We had the following number of radios checking in.

6 running TS-520(x)
1 running TS-530(x)
0 running TS-820(x)
5 running TS-830S
0 running TS-510
0 running TS-511
1 running 599 twins
0 running TS-900

He was running his TS-520 + Heathkit SB-200 amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and TS-940s,
which of course is not a hybrid, although over
30+ years old. Everyone is welcome as long as
they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins

Nov. 2014 ☐ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturdays net total = 66, Sundays total = 46

December 2015, Saturdays net total = 55, Sundays total = 73

January 2016, Saturdays net total = 129, Sundays total = 81

February 2016, Saturdays net total = 98, Sundays total = 72

March 2016, Saturdays net total = 74, Sundays total = 35

April 2016, Saturdays net total = 41, Sundays total = 24 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo

Hi, I am trying to restore this radio for a 98 year old amateur radio operator. The transmitter was not working but the receiver was until he discharged the main filter caps after which the receiver went dead. There are no meter readings. No HV in tune or send indicated however 800 volts is present on the main filter caps. I thought I would try to fix the receiver first. There is no audio . The S- meter does go up when rf gain is reduced. The digital readout is correct on all bands. The rit does change the readout but nothing happens in xit. I checked the 12 volt, 9 volt and 3.6 volt supplies and they are ok. I injected a audio signal into q4 and the audio works at that point. I injected the 8.830 IF signal into TP2 (rif) on the RF board and nothing happens. I injected 14.2 mcs into the antenna connector and can see this at TP 1 on the RF board. I looked at the VCO signal at TP 3 on the RF board and it is 2.7 volts at about 23 mcs. With a 300mv 14.2 mcs signal at the antenna I see a 1.45 volt 14.2 mcs signal at S1-2 on the RF board thus I assume L41 is ok. I looked at S1-4 to look at the output of L13 on the RF board and see nothing with the same signal into the antenna connector. Q1 circuit bad? I see nothing at the MKR input to the RF board with the marker turned on. I tried injecting a 14.2 mcs signal at the output of L13 on the RF board S1-4 and no output at TP 2. I also cleaned the bandswitch with CRC cleaner. I sure would like to get this right working for my 98 year old amateur. Any suggestions would be most appreciated. Thanks Derek K9fqo

Hi, I injected a 8.830 signal into tp2 on the RF board. I see the signal at the input to the IF board. I see an amplified signal at connector 1 pin 1 which I assume means q1 is ok. I see the 8.375 vbt oscillator signal at TP1 of the IF board. I see a 455 kc 800 mv signal at connector 11 IF board

pins 3 and 4. I see nothing at pin 1 detector output. If I inject a 1500

hz signal at this point I have excellent audio output. Could d20-24 be bad? Again receiver went deaf after the owner discharged the HV supply caps. At age 98 I don't know how long the owner has to enjoy this set! Any ideas would be appreciated. Thanks Derek K9fqo

If you inject 8.830mhz at around -63dBm at TP-2 on the RF board you should see approx S7 to S8 on the S-meter and hear approx a 1khz note in the speaker in LSB and a 1500 hz note in USB.

At the output of the Product Detector at Conn 11 Pin 1 should see approx 100mv P-P @ 1khz in LSB mode. You can also modulate the 8.830 with 400hz or 1000hz but it isnt needed. If you dont have that it could mean bad PD diodes or it could mean bad solder at Pin 1 pin pad or cracked PC trace. Can you wiggle Conn 11 side to side? If so, that is not good.

You say you have approx 800mv of CIO at Conn 11 Pins 3 and 4. That is good, but doesnt mean CIO is available at the PD diodes. Molex connectors are a weak link especially on the IF board which sees frequent unplug and plug cycles often inducing cracked pin soldering or cracked pc traces.

I would measure CIO level at cathode leads of D21 and D23. Should see about half of that 800mv level.

OK even though you said you saw your test 8.830 RIF at Conn 6 Pin 6 on the IF board it doesnt mean that Pin 6 is making good contact with its pin pad and associated PC trace. Humor me and try injecting test RIF at Conn 6 Pin 6. If nothing then try injecting at IF Out 1 rear panel RCA jack.

Appears that you have proper CIO at the Product Detector, but not seeing any IF.

If still nothing by injecting at IFO1 then move on to diode D6 cathode at 8.830 Xtal Filter. Just have to keep signal injecting until rig comes alive. As you report the AGC bus is powered.

If you have to go beyond Q2/Q3 Mixer make sure to switch from 8.830 to 455khz. D34 anode is an easy place to inject at. -43dBm there should give loud tone and approx S7 indication.

If I inject a 1500 hz signal at this point I have excellent audio output. Could d20-24 be bad? Again receiver went deaf after the owner discharged the HV supply caps. At age 98 I don't know how long the owner has to enjoy this set! Any ideas would be appreciated. Thanks Derek K9fqo

Maybe I missed it but did you verify that you have 12vdc at Conn 6 Pin 1 while you were there checking at that Molex Conn for your test RIF signal?

You can also get on the Drain and Source of Q1 FET (near Conn 6) to confirm that the 12vdc is making it from Conn 6 Pin 1. If you dont have a micro or needle point test probe can use mini-grabber test jumper and a hobby floral arrangement pin with some sleeving over most of the pin accept the needle point and at the area at the top to clip the grabber on.

Hi Terry, I have 12vdc at connector 6 pin one. I will try to see if I have 12 vdc on q1 however I suspect I have as I see an amplified signal at if out connector . I injected a 2mv signal into connector 6 pin 6 as well as the IF out and nothing. Injecting into D34 however does give me a weak audio output! No S meter change ! Thanks Derek K9fqo

OK ordinarily I dont jump around taking DC voltages but since you were there didnt hurt.

OK making progress if you get some audio at D34.

Jump ahead to Q8 last IF amp. It is near Conn 10 on outer rear edge of the IF board. Looking down on the package Drain is upper right lead and Source is bottom right lead. Inject 400hz or 1000hz modulated 455khz at -23dBm (around 15mv) into the Source lead. Should see approx S6 and hear the tone in the speaker.

If nothing move to the Drain. At the Drain you are now injecting into the Produce Detector and the AGC Detector buffer amp. It is very easy to peg the S meter hard at this point. If you do just turn AGC selector to OFF until you can lower the test IF. Around -11dBm should give AGC action and S meter indication without pegging (around S3 or so). -10dBm will probably peg it hard.

If this works then you know that the Product Detector will work if provided proper CIO and IF levels. Then you need to just inject on the path between D34 and Q8 to see where you are losing the IF signal since you already verified that you have the CIO.

OK I had one other error. I mentioned injecting at the Source lead of Q8 IF amp and meant at Gate 1. Looking down on the package with radio front panel facing you G1 is at the bottom left.

You can inject test RF at the Source lead, but the normal IF signal path is G1.

If you get no audio and no S-meter when injecting at G1 try injecting at the Drain. If you get audio and S meter indication at the Drain then problem is with Q8 or its dc voltages.

Before replacing Q8 you need to take DSG1G2 DC levels. Very rare for Q8 to fail. More likely that it would not be seeing its bias at G1 which is switched by the RL-1 Aux Control relay on the Audio Board to supply RB2 at Conn 9. Conn 9 Pin 5 RB2 should read approx 2.0vdc in Rx mode.

This relay is the flat pack Omron LZN4 relay which is source of many operational problems. If you find that the contacts in RL-1 are the problem it is not very practical and not very long lived fix to clean the contacts. Better fix is to replace the relay with Ken K4EAA new relay board with plug in relays.

54539. TS-820S Intermittent Digital Counter

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-16 13:49:59 UTC
From: dr.intrepid@...
Topic: 54539 Message: 54539

The digital counter on my TS-820S works intermittently. Generally, it just shows two decimal points. Other times it works well. Is the following information the correct procedure for fixing the problem?

Here is something you can do if your digital display on the kenwood ts-820 is giving you a problem.....

1. Remove the counter assembly unit from the 820.
2. Remove both circuit boards from the counter assembly (upper and lower boards).
3. Scrape away the varnish from the corners of the boards where the interconnecting screws and spacers hold the boards into the case.
4. Reassemble the counter....
That should take care of the problem..

Is there any additional steps or procedures for this problem.

Thank you,

David Richer, WB6VGO

Hello George,

Don't know who or where to ask at the moment but I found your post.

I am having difficulties with pin 5 of the finals on my TS-530sp. I have (0) voltage there. I have been battling with the schematics trying to figure where the -110, -65 vdc is supposed to come from. It shows from the finals pin 5 thru the AF board on Q31. ???

Would you know where it comes from? I have no plate current and the rig has 0 output. The 12ay7a is producing RF to the finals board.

Regards,
Tony

54541. Inconsistencies in Adjustments part of TS820S Service manual

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-16 09:25:50 UTC
From: rolf.vainio@...
Topic: 54541 Message: 54541

Hi esteemed group.

As an selfeducational project I have been able to blow life in the receiver part and the audio chain of an TS820S but am now stuck with adjustments. Hopefully someone more knowledgeable could comment these questions.

TS820S Service manual page 45. “2. Adjustment of Receiver Section, 2.1. Carrier unit adjustment, Point 2. Adjusting procedure” sub point 1) calls for adjusting oscillation coil T1 on CAR-1 unit X-50-1310-00 (the upper board) to read 50 mV on a meter connected to TP5 at IF unit. Tried this and there was no response. Then tried adjusting the T1 on the lower board, CAR2 (X50-1320-00) and adjusting the voltage to 50 mV worked like a charm. Question, is this an error in the manual?

Further sub point 2) instructs “Set the MODE switch to CW and the STBY switch to SEND and adjust oscillation coil T1 in CAR 1 unit X50-1320-00 similarly.”

There is no such thing, it is either CAR 2 or X50-1310-00, which one would be right? Anyhow the minute I switch STBY switch to SEND the 50 mVolts at TP5 on IF board drop to zero Volts so no adjustment is possible! Would appreciate any educated comments.

Rolf

Did you have the AGC Off? If so, you wont have any S meter indication. If you had AGC On and no S meter indication then verify that you have -6vdc at Conn 3.

Injecting at Drain of Q8 proves that the Product Detector is working.

RB2 provides the operating bias voltage for Q4 and Q8 and sets the operating point on the linear portion of the mosfet load line. In Rx should see approx + 2.0 vdc and when you flip to Send should see approx -2.90vdc.

Go to Conn 7 on the Audio Board and see if you have -6vdc there. -6vdc will be common to no S meter problem and the 4 vdc bias you are seeing at RB2. -6vdc is supplied by the T-powered supply on the Counter Board. Go to Conn 2 Pin 12 to see if you have -6vdc.

Try wiggling around gently all of the -6vdc Molex Connectors. Conn 2 Counter Board, Conn 7 Audio Board, and Conn 3 IF board.

Very unlikely anything wrong with the caps.

Of course need D12 and D13 biased on to pass any signal. Are you injecting in SSB mode or CW Wide Mode? Also what level signal are you using? You wont see any S-meter deflection, but should hear the 400hz modulated 8.830mhz test signal. It will take pretty big signal for much volume. I would say at least -13dBm (50mv). To see S meter deflection you will need to just tap your test signal hot lead on and off of D13 anode with the AGC turned on (fast).

Did you measure voltage at Anode of D13? If not do so, should be around 4.2vdc and when you connect your DMM should hear noise in the speaker. Should have about 2.5vdc at Cathode of D12.

Hi Terry, I measure .04 vdc at connector 3 if board, .4mv vdc at connector

7 audio board, .04 vdc pin 12 counter unit. Wiggling did not help. I injected 15 mv 455 kcs 400 hz modulation into d13 anode I hear weak audio in usb, cw n and cw w modes but not lsb. D13 anode measures -.88 vdc. D12 cathode measures -2.1 vdc. Pin 5 connector 9 measures 4.8 vdc with agc off, fast or slow. ?? Help! I wish I knew more but I am learning! Derek K9fqo

54553. Re: Inconsistencies in Adjustments part of TS820S Service manual

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-17 21:36:07 UTC
From: wagstw46@...
Topic: 54541 Message: 54553

Yes sadly the TS820 Service manual is not very good. Many errors and I am not talking about translation issues.

In some cases wrong test point, wrong acceptance criteria, and wrong adjustment point called out in one step! Takes a bit of experience to realize that 50mv Carrier Osc level would never do very well as the LO for the Mixers. You now know to set them to 300mv and you will have to flip to Send to set the TX Carrier osc.

It begins with the very first step where you adjust the AGC bus reference voltage RF-1. The Service Manual tells you to set it to 3.3vdc and depending on what ref of the Owners Operating Manual you have under Sect 6 Maintenance it tells you to set it to 3.5vdc. In this case it is not anything that will make drastic difference in the performance, but which one would you chose? Obviously more gain with higher servo/control voltage on Gate 2 of the IF and RF gain controlled devices, but it isnt all about max gain.

I do a complete SM alignment on all radios that cross my bench. Not as substitute for troubleshooting, but to re-baseline the radio. I have no idea how many owners and how many people have been under the hood. So no need to do complete alignment on any repeat frequency and always risk of breaking a core or some other component.

Lastly, one other example of a gross error is in the alignment steps of the RF processor. It directs you to set the 455 khz carrier oscillator to 451.4khz. If you do that you wont have any audio in the ceramic filters passband. At minimum you would want to be around 453.0 khz. This is a case where if you follow the steps as written you would be able to immediately and easily detect that something was wrong. Not always the case with all the steps.

I wish there was an easy answer for you. I guess best you can do is come here and ask when something doesnt seem right to you. Hopefully you will have good instincts.

Do you have 12vdc at Counter Unit Board Conn 2 Pin 1 (red wire)?

No point in going anywhere until you re-establish -6vdc supply from the Counter Unit Board. Until you get RB2 back to approx 2vdc you wont have an operable Q4/Q8 IF amp chain. RB2 also biases your Q2/Q3 mixer. Also, with no -6vdc you wont have any S meter action as Q10 AGC Amp wont be operable.

It is possible if your filter switching diode voltages are in fact as you reported that you have multiple problems.

Need to attack one problem at a time. No point in doing any signal injection until you get -6vdc to the IF and Audio boards. Then you can move on to the bias voltage for D12 and D13. It is possible you have a bad switching diode.

One trick you can do is to jumper out Murata filter CF-2. Can do that by jumpering with a .01uf or .047uf cap (value not critical). Jumper from Anode of D34 to Gate 1 of Q4. Dont rush to do that until you restore -6vdc and get RB2 bias back to normal.

Do you have a bench supply or a 6vdc lantern battery? If so, can use it to power -6vdc bus by connecting plus to chassis ground and minus to Counter Unit Conn 2 Pin 12.

Hi Terry, I do have 12vdc connector 2 pin 1 red wire. I did an continuity

check between connector 2 pin 12 and connector 3 if board and connector 7 audio board. I have continuity. Thus no minus 6 vdc out of counter board. Suggestions before I inject minus 6 vdc into pin 12 connector 2 counter board? I have the maintenance manual and purchased a 2 by 3 foot schematic of the Kenwood ts 830s from k4eaa. My counter schematic from the maintenance manual is not legible. Thanks Derek K9fqo

Thanks Terry, I will proceed as you have directed. I did double check the

d12-d13 diode voltages with two tektronix multimeters. I have a tektronix

bench power supply to provide -6 vdc if needed. Again the owner reported that the receiver went deaf after he discharged the HV electrolytics. The RF board as previously noted has no output but has VCO. I will concentrate

on the minus 6 volt bus. Thanks again Derek

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Saturday net was run me, WB0IQK. There were
29 stations checking in under good
conditions. There was 13 new station checking in.

We had the following number of radios checking in.

0 running TS-520(x)
3 running TS-530(x)
4 running TS-820(x)
3 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
1 running TS-900

I was running my TS-830S and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
9 stations checking in under good
conditions. There was 1 new station checking in; VA7ZR.

We had the following number of radios checking in.

5 running TS-520(x)
0 running TS-530(x)
2 running TS-820(x)
0 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,

although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:

Hi Dave:

I dont know?

First step would be to see if there is 12vdc to the Molex Conn then go to Q12 where it is very easy to see if the 12vdc is there. He might be able to also get on L1.

If no 12 vdc at Q12 then either bad solder at the molex pin pad or as you say a hair line crack at the pin pad to trace transition. That is possible especially if there has been multiple plug and un-plug cycles which is not common with the Counter Unit board.

I wouldnt assume either molex condition exists and start pulling board to visually inspect. I would measure first. Easy to measure.

It appears that he has multiple problems? I would still restore -6vdc first and make sure has 2.0vdc RB2 bias at IF board. That should get the Mixer fired up and the IF amps. Then can go back to signal injection/tracing.

I understand he believes radio was working properly before discharging HV caps. Discharge of HV caps shortly after power down if not using any kind of current limiting jumper lead (using a screw driver for example) will result in significant energy in a very short time period. However, only thing that should see that transient is the HV caps themselves. Off top of my head I dont see the correlation. It is pretty easy to make wrong cause and effect determinations. Of course strange thinks can happen.

Take Care
Terry K9TW

Derek:

Some of these tests can be performed in a matter of minutes.

I understand that the owner reports that the receiver died after discharge of HV filter caps. I am not discounting it as the root cause, but have to say very unlikely that it would cause failure of the -6vdc supply. A transient on the 120vac line into his home or input to the SO-239 is far more likely to cause a wide variety of faults. You and I did not witness what he did nor do we know if the radio was in fact working properly before the HV cap discharge.

All we can do is troubleshoot the existing condition.

I understand that you early on reported no RIF signal at TP-2 on RF board and that you have VCO signal. RIF Mixer needs more than VCO (LO) to produce 8.830mhz output (it will be a very low level signal). In addition to LO it needs RF which starts with output from Q1 RF amp. You also need proper DC voltages.

I believe I asked you early on if you had 12vdc to Q3/Q4 and you reported that you did. I dont believe that I asked you if you also had operating bias for Q. With this finding that RB2 is not correct I would also check RB1 and RLR. RB1 will be affected similar to RB2 if you have no -6vdc. Go to RF board and measure RB1 at Conn 8. If it is around 4vdc as RB2 is then RF amp Q1 wont work and you will have no RF input to the RIF Mixer. RLR is RL-1 switched 9vdc and is needed to key transistor switch Q5 which is used to ground the Source lead of all the RF chain active devices (Q1, Q2, and Q3/Q4). If RLR isnt proper it is usually due to bad RL-1 relay contact.

Again suggest you focus on restoring -6vdc and a very quick test would be to apply -6vdc from bench supply and turn the Marker on and see if you then have audio from speaker and S meter action.

Thank you again Terry , Replacing istincts with some equipment. Received a working 25 Meg CRT oscilloscope f(year 1977 , about same as my TS 820S) from a friendly neighbour. In addition ordered a low cost signal generator (MHS2300A 25 MHz). Will educate myself on the earlier messages from you and others while waiting for that. Will thus be better equipped for the next dust with the TS820S.

Hi Dave or Terry, I think I see what is wrong with the minus 6 volt supply. Q12 measures fine with collector at 12 vdc and base at minus 3 vdc. I see minus 24 volts at the right side of r14. I see 0 vdc at the anode of d7 6 volt zener. I measure 0 ohms at the anode of d7 no mater which way my multimeter leads are placed . Between l4 and the molex connector I have continuity. With connector 2 pulled I measure infinite resistance across l4 while a dead short at the right side of r15 or D7 anode. Thus I believe D7 is shorted and L4 open. Does this make sense? If so I have a 6.2 volt zener 1/2 watt if that would work? Where to find 150 uh ferrite inductor?
I measured rf board connector 8 pin 2 and get 4.3 volts. Thus from what you suggested rl1 is likely bad. I have a replacement from k4eaa ready to install!
Rlr measured at pin 5 connector 7 at audio board measures 9 vdc but at rf board connector 3 pin 1 measures minus .33 vdc.
My 98 year old amateur radio operator owner of this kenwood ts 830s w0ztl sure appreciates all your help as do I. Thanks Derek K9fqo

Derek,

I haven't kept up nor read all the messages. T I saw a issue with the -6volt line and usual place to loose this rail is at counter board, due to cracked track/pads. Firstly, I.d replace the relay and whilst the board Osbourne using high magnification and good lighting check for cracked pad bad solder joints.
As for the diode easy to check but must pull out tho check. As I am ocd with parts. I only install same value components, if the inductor is toast, then must be replaced. You should check for continuity with Molex leads and all supply voltages must be on each board. I'm in dint that this occurred just from discharging caps, but if no servicing was being done, why was the need for cap/if discharge.

Rl1 is a huge source of problems, when I get radios on my bench, there are certain components that get replaced if still original, no ifs or buts. If you find a crack solver pad, must remove old solder, give light sand and apply new solder to ensure good connection. don't over heat tracks or they will lift .

You can replace RL-1 with one of Ken K4EAA new relay boards. A good thing to do, but that wont restore normal RB-2 and RB-1 bias voltage.

If you do not restore -6vdc then you wont have any bucking or series opposing voltage to work with the 9vdc to produce the proper bias voltage levels. Pretty sure I suggested more than once to parallel up bench supply or 6vdc lantern battery to the -6vdc bus and see if it restores RB2/RB1.

My TS820 has recently acquired "Birdies" on 40 MTRs and on 20 MTRs. I haven't checked the other bands. I get a stron signal, un-modulated, every 30.9KHZ. I can't even guess where they are coming from; I suspect a trap is shorted somwhere. I get these signals even when my rig is connected to a dummy load so I'm pretty sure they are being generated internally. Any suggestions will be appreciated.

Hi Terry and Mike, Sorry that I did not try injecting minus 6 volts earlier! This morning I tried this with a one amp bench supply and the current limiter dropped the voltage to near 0. I measure 115 ohms at the minus 6 volt supply on the counter board. If my arithmetic is correct that translates into about 50ma. I then tried my other bench supply that can provide up to 2 amps and is metered for both volts and amps. This supply provided minus two volts at 1.75 amps(when set at minus 6 volts). I don't understand this. I measure minus 24 volts at the right side of r14 but 0 volts at the anode of D7. The counter works fine. Pulling connector 2 I still measure 115 ohms at minus 6 on connector 7 pin 7 on audio board. I have continuity between connector 12 (_6v) and l4 on counter board. I measure infinite resistance at pin 12 or at l4. I can see the lead from l4 going into the tracing that goes directly to pin 12. I measure 0 ohms on the anode of D7 to ground. Thus I conclude that l4 is open and likely D7 is shorted. Does this imply that perhaps the resistance when the unit is powered actually drops to near 0? If my analysis is correct then there must be a short in the minus 6 volt bus? This might then have toasted l4 and D7? The connection from the minus 24 volt supply and the counter comes off of the right side of r14. This would explain why the counter works fine. I again apologize for not doing this earlier! Thanks again for all your help and patience! 73's Derek K9fqo

Jim:

Even though it's reasonable to initially assume that the signals are generated internally, they might be from an external source- a power supply for an unrelated item (think- computer, maybe?) whose power supply has gone south or that is newly introduced in your home. If you can kill power to all of the circuits in your house other than the one feeding the TS820, and unplug any items on the same (15 or 20 amp) circuit that's feeding the TS820, you can check this.

Agreed,

Birdies spaced around 30kHz apart may be caused
by plasma TVs, internet routers, ethernet hubs,
some switchmode power supplies, USB devices -
etc. I've had birdies from a nearby PC ethernet
port cause such birdies even with my radio
connected to a dummy load. The solution was to
reduce the speed from 100mb/s to 10mb/s.

Mike has a good troubleshooting step plus I would
try another receiver placed near the 820 to
confirm/eliminate the source of the birdies is coming from outside the radio.

Over the last few years I have been noticing more of these dead carriers that come and go at random spacings across most of the bands and generally across the lower HF spectrum. In the last year there have been "sweepers" that go rapidly back and forth a segment of about 20-30 KHz over and over and can be operating on several different bands at the same time then go away for a while. I hear them in two different Amateur radios, Kenwood and Yaesu and now on my new AM-FM-SSB-CW short /long wave FMBC.portable radioPulling the antenna makes them disappear. We have had two cable providers in the area, we switched providers for our TV/Phone and Internet a few times (escalating bill charges during a no rate increase plan, with no explanation) and each time seems to bring on more interference but killing the modems and TV boxes (removing the wiring and power) doesn't seem to stop the interference to the radios. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Welcome to the 21st century.

Here in Australia the noise floor has been creeping up steadily over the years and with our Federal government plan to roll out highspeed internet for everyone the situation will continue to get worse. New age consumer good that are now known to cause birdies and other interference include Solar power systems (See QST recently), LED lighting, headphone and AV senders, faulty SMPS wall warts as well as computers and peripherals including USB devices, ethernet devices and here in our country the fibre cable termination box that must be installed in our house once we join our National Broadband Network (NBN).

The tough part is that in most cases the consumer is unaffected by the interference and are barely interested in helping resolve the interference issue particularly if it costs them money or stops them from using the offending device. Many times the interference is clearly due to a device that is operating outside the specified EMR compliance limits either because it is faulty or just plain poor design. Sadly it falls to we hams at the bottom of the food chain to identify the issue and try and get someone to listen and do the right thing. You just have to hope that the faulty item is also interfering with TV or cable, or broadcast radio or internet access otherwise your road will be a long one. Telling a utility company their product is affecting ham radio doesn't impart the same sense of urgency that was once the case.

So back to the issue at hand. Interference at evenly spaced intervals through-out the spectrum especially around 30kHz to 50kHz apart is generally due to some external influence.

Regards

Lou

So far I’m getting good tips. Thanks very much. I wonder if what I seeing a spread spectrum kind of emission? Maybe its like a “bluetooth” or the like. I’m suspicious that the “smart” electric meter that’s been installed on my house has awakened and is sending poweline carrier signals into my house. I’m a former utility engineer and I know the local utility is brining up their system.

Subject: Re: [TS-520_820_530_830] TS 820S Birdies

Over the last few years I have been noticing more of these dead carriers that come and go at random spacings across most of the bands and generally across the lower HF spectrum. In the last year there have been "sweepers" that go rapidly back and forth a segment of about 20-30 KHz over and over and can be operating on several different bands at the same time then go away for a while.

I hear them in two different Amateur radios, Kenwood and Yaesu and now on my new AM-FM-SSB-CW short /long wave FMBC.portable radio

Pulling the antenna makes them disappear.

We have had two cable providers in the area, we switched providers for our TV/Phone and Internet a few times (escalating bill charges during a no rate increase plan, with no explanation) and each time seems to bring on more interference but killing the modems and TV boxes (removing the wiring and power) doesn't seem to stop the interference to the radios.

My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Subject: Re: [TS-520_820_530_830] TS 820S Birdies

Agreed,

Birdies spaced around 30kHz apart may be caused by plasma TVs, internet routers, ethernet hubs, some switchmode power supplies, USB devices - etc. I've had birdies from a nearby PC ethernet port cause such birdies even with my radio connected to a dummy load. The solution was to reduce the speed from 100mb/s to 10mb/s.

Mike has a good troubleshooting step plus I would try another receiver placed near the 820 to confirm/eliminate the source of the birdies is coming from outside the radio.

Are you running one of those ethernet over power wiring adapters by any chance? They will definitely generate strong birdies all over the bands and it will be picked up by your radio via the power cable.

Cheers,
Peter - VK2AN

We have had both shielded coax from ComCast Cable AND the twisted pairs (ethernet cable like CAT-5 on steroids) from AT & T for our bundled Internet/TelePhone/TV service. A prime suspect, but I have disconnected the modems & TV boxes and powered them down to see What happened to the "birdies"...Nothing. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Hi Dave and Terry, I pulled connector 7 on the audio board. Now I measure around 7 k on the minus 6 volt bus! I measure 117 ohms at pin 7 on connector 7 at the audio board. Thus I believe there has to be a short. I am going to pull the audio board and see if I can not track it down. While I have the board out I will replace rl1 as I bought a replacement from k4eaa. Thus if my analysis is correct the short on the audio board toasted l4 on the counter board and likely the 6 volt zener. Thanks again for all your help. 73's Derek K9fqo

Peter,

I don't have any ethernet over powerline devices. I do have "smart" electric meters and they might be using a powerline communications scheme for in-house communications. I have to research that. The local utility is just rolling out this functionality. I think I'll get my generator out of the garage and fire it up and power my TS820 off it. Then I can dump the whole house and see what happens.

I then tried my other bench supply that can provide up to 2 amps and is metered for both volts and amps. This supply provided minus two volts at 1.75 amps(when set at minus 6 volts). I don't understand this. I measure minus 24 volts at the right side of r14 but 0 volts at the anode of D7. The counter works fine. Pulling connector 2 I still measure 115 ohms at minus 6 on connector 7 pin 7 on audio board. I have continuity between connector 12 (_6v) and l4 on counter board. I measure infinite resistance at pin 12 or at l4. I can see the lead from l4 going into the tracing that goes directly to pin 12. I measure 0 ohms on the anode of D7 to ground. Thus I conclude that l4 is open and likely D7 is shorted. Does this imply that perhaps the resistance when the unit is powered actually drops to near 0? If my analysis is correct then there must be a short in the minus 6 volt bus? This might then have toasted l4 and D7? The connection from the minus 24 volt supply and the counter comes off of the right side of r14. This would explain why the counter works fine. I again apologize for not doing this earlier! Thanks again for all your help and patience! 73's Derek K9fqo

Derek,

You do not need to remove the heatsink screws to remove at board. Personally i would remove all the molex connectors first then remove screws. This will allow for easier removal of rl1. Make sure you check foil side of board using high magnification and good lighting for dry joints or cracks. then once reinstalled check all voltages on all boards. Especially concentrate on -6v. Highly unlikely -6v rail has failed, more likely has fault somewhere after source. Also do you have service manual? If not you can download from Mike's webpage.

Hi Dave. I do have the service manual as well as the 24 by 36 inch schematic from k4eaa. Thanks Derek K9fqo

Derek.
The st board heat sink is a snug fit against the chassis, the only screws holding board down are the round headed screws ant 6 from memory. Have a look in the service manual, exploded view af board.
I noted you have lost -6v at counter board, what I'm trying to establish is it only the counter board of is it prior to counter board. Without this rail as you can see all is dead.

I have repair many radios with similar symptoms, majority were either ad board or counter board cracked tracks.

I have not read all posts, Terry, has given perfect advice and is an absolute outstanding teacher, I wish I could explain as well as he does.
The Rl1 on ad board gives a huge amount of problems especially after 30+ years. Ken's New boards relays are so much better.
Because we are doing this remotely will take a little longer. But we will fix, have a look at Terry's webpage and download his conversion table for dBm/mv. Kenwood uses Japanese standard measurements. Unsure if you were aware or not, but no harm advising.

If you still have no joy once relay replaced, inject -6v firstly at af board, if no joy there go to counter board and inject ,-6v. Must establish where -6v has failed

Hi Dave, First I thank you for your consideration! I will summarize my findings. I understand that the minus 6 volt rail is needed for all the biasing. Neither the receiver or transmitter is operational. I decided to troubleshoot the receiver first. The supply voltages are all correct except for the minus 6 volt rail. I injected 14.2 mcs into antenna connector. I have VCO at tp3 rf board but no 8 MC if out at tp2.
Looking at counter board I have 12 vdc at connector 1 pin 3 and connector 2 pin 1. I have 12 vdc collector voltage q12 and minus 3 vdc base voltage. I see minus 24 vdc on the right side of r14. The counter works fine and displays correctly on all bands. I have 0 vdc at the anode of D7 the 6 volt zener. I have a dead short also at this point. With connector 2 pulled I have infinite resistance from pin 12 of connector 2 to anode of D7. Thus I believe l4 is open and D7 likely shorted. I can see the lead from l4 going into the tracing to pin 12 on connector 2. I have continuity to pin 12. With connector 2 plugged in I measure about 115 ohms to ground. With minus 6 volt bench supply injected into pin 12 the voltage drops to 2 volts at 1.75 amps do to current limiting. I pulled the connector 7 on the AF board and the resistance came up to around 7500 ohms on the minus 6 volt rail. I measured the resistance at pin 7 connector 7 on the AF board and found it to be around 115 ohms to ground! The minus 6 volts on pin 7 goes directly to the collector of Q18. There is no continuity between the two! Thus I conclude that something is shorted and or cracked tracing between Q18 emitter and the minus 6 volt line. In summary if correct I conclude that this short caused l4 plus or minus D7 to fail.
I will download the dbm-mv chart which will be useful. Thank you! I will study the parts breakdown for the AF board removal. I have k4eaa's replacement rl-1 ready to install. Hopefully this summary will help you understand my observations! Incidentally I am blessed with a first rate test bench. Thanks again Derek K9fqo

Derek,

Thank you for summary. If we were closer easier to show. Ok on test bench, does that include rd millivolt meter, this is essential for rif and tif measurements. The af board is easy to remove. Let me know when you install Rl1, don't put board back in as I will need you to check a particular problem track. And need to organize a photo to assist you.

Derek,
With the rig upside down and covers off and the VFO facing you, look at the LEFT side of the AF unit heat sink,along the side chassis rail, remove the 2 screws. Look now at the front edge of the of the heat sink right behind the IF shift/notch control,remove that screw, then remove the screw that is at the upper right corner of the AF board. The AF board can now be GENTLY folded over to the right. The heatsink runs around two sides and does not cover the bottom. Do this with power off and rig unplugged. You can reapply power, just make sure that you have a piece of cardboard, or other insulating material under the AF board as there is very HV right there...that can and will make your rig a smokin' pile of junk of not making you SK

  Derek,

Thank you for summary. If we were closer easier to show. Ok on test bench, does that include rd millivolt meter, this is essential for rif and tif measurements. The af board is easy to remove. Let me know when you install Rl1, don't put board back in as I will need you to check a particular problem track. And need to organize a photo to assist you.

 Hi Dave, First I thank you for your consideration! I will summarize my findings. I understand that the minus 6 volt rail is needed for all the biasing. Neither the receiver or transmitter is operational. I decided to troubleshoot the receiver first. The supply voltages are all correct except for the minus 6 volt rail. I injected 14.2 mcs into antenna connector. I have VCO at tp3 rf board but no 8 MC if out at tp2.
Looking at counter board I have 12 vdc at connector 1 pin 3 and connector 2 pin 1. I have 12 vdc collector voltage q12 and minus 3 vdc base voltage. I see minus 24 vdc on the right side of r14. The counter works fine and displays correctly on all bands. I have 0 vdc at the anode of D7 the 6 volt zener. I have a dead short also at this point. With connector 2 pulled I have infinite resistance from pin 12 of connector 2 to anode of D7. Thus I believe l4 is open and D7 likely shorted. I can see the lead from l4 going into the tracing to pin 12 on connector 2. I have continuity to pin 12. With connector 2 plugged in I measure about 115 ohms to ground. With minus 6 volt bench supply injected into pin 12 the voltage drops to 2 volts at 1.75 amps do to current limiting. I pulled the connector 7 on the AF board and the resistance came up to around 7500 ohms on the minus 6 volt rail. I

measured the resistance at pin 7 connector 7 on the AF board and found it to be around 115 ohms to ground! The minus 6 volts on pin 7 goes directly to the collector of Q18. There is no continuity between the two! Thus I conclude that something is shorted and or cracked tracing between Q18 emitter and the minus 6 volt line. In summary if correct I conclude that this short caused l4 plus or minus D7 to fail.
I will download the dbm-mv chart which will be useful. Thank you! I will study the parts breakdown for the AF board removal. I have k4eaa's replacement rl-1 ready to install. Hopefully this summary will help you understand my observations! Incidentally I am blessed with a first rate test bench. Thanks again Derek K9fqoOn Apr 20, 2016 7:29 PM, "Fpath fpath@... Derek.
The st board heat sink is a snug fit against the chassis, the only screws holding board down are the round headed screws ant 6 from memory. Have a look in the service manual, exploded view af board.
I noted you have lost -6v at counter board, what I'm trying to establish is it only the counter board of is it prior to counter board. Without this rail as you can see all is dead.

I have repair many radios with similar symptoms, majority were either ad board or counter board cracked tracks.

I have not read all posts, Terry, has given perfect advice and is an absolute outstanding teacher, I wish I could explain as well as he does.
The Rl1 on ad board gives a huge amount of problems especially after 30+ years. Ken's New boards relays are so much better.
Because we are doing this remotely will take a little longer. But we will fix, have a look at Terry's webpage and download his conversion table for dBm/mv. Kenwood uses Japanese standard measurements. Unsure if you were aware or not, but no harm advising.

If you still have no joy once relay replaced, inject -6v firstly at af board, if no joy there go to counter board and inject ,-6v. Must establish where -6v has failed

From: J Evans
Topic: 54567 Message: 54588

I think the culprit is my HP Laser Fax/Printer/Scanner. I could see ethernet activity on the lights on my ATT Uverse box that coincided with the noise on one of the birdies. I went around and shut down every ethernet device and listened. I got suspicious of my WiFi router but not it. When I got the the HP box I shut it down and the birdie went away. My suspicion is that this is trying to make a wireless connection even though it is on a wired network. I'm going to see if I can disable the wireless feature.

Thanks all for the suggestions and help.

Jim W8JWE

Subject: Re: [TS-520_820_530_830] Re: TS 820S Birdies

We have had both shielded coax from ComCast Cable AND the twisted pairs (ethernet cable like CAT-5 on steroids) from AT & T for our bundled Internet/TelePhone/TV service.

A prime suspect, but I have disconnected the modems & TV boxes and powered them down to see What happened to the "birdies"...Nothing.

My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Are you running one of those ethernet over power wiring adapters by any chance? They will definitely generate strong birdies all over the bands and it will be picked up by your radio via the power cable.

Cheers,

Good morning Joe! Thank you very much. Now I see what to do. The right edge of the AF board is broken off and the front screw is missing so someone has messed with this board before. Now I will be able to replace RL-1 and trace the minus 7 path which has only 115 ohms to ground and no connection to Q18 emitter!
Good morning Dave, Yes I can measure low RF voltages as I have a Tektronix TDS 3054B scope plus a Tektronix RSA 3308A 8 ghz real time spectrum analyzer. Progress!! Thanks again. Derek K9fqo

Hi everyone! Just got my first '820S since my first one in 1982. Great to have one again. Only one problem: the 20M bandswitch position reads "19.000.0" , so does the JJY/WWV position. All the other bands are spot on and power out is pretty decent.

Anyone help me with adjusting this, please?

Sandy,
If you do not have one already, obtain the Service Manual. You can find good ones at: w5rkl"dot"com (Mike-group member) and n6wk"dot"com (Gordon-group member but now SK). Look on page 40, it should give you a good start

Hi, everybody,

How to get the TS820 in QRP mode?

I want to use this radio with digital modes (only 20 Watt).

I was thinking doing it acroos the ALC signal, but how to do?

I will apreciate any oppinion.

Jose (CP6CL)

The yahooligan group archives are a stone <expletive deleted> to try to search, but I have been keeping my own local copies since I joined to make finding something a bit easier.

Try

https://groups.yahoo.com/neo/groups/TS-520_820_530_830/conversations/topics/48938

since this topic has been covered, dug up, re-buried, filed, folded, bent, spindled, and mutilated over and over again on this forum. There are also some schematics or drawings and instructions in the "files" section of the web-based thing, and you can try looking there for file names containing "qrp" at a guess.

Good luck, hope the above link at least gets you closer.

Hi Gary,

I had to replace the 29MHz band crystal (X8) in
my TS520S but I'm sure the following method will help you too.

A previous owner had replaced the original
crystal with one to suit the 27MHz band. As luck
would have it the crystal is right underneath the
band switch and probably the most difficult one
of the lot to access. Looking at the board layout
and the service manual it seemed to me that it's
quite a job to remove the OSC COIL board just to
replace the crystal. I decided to try and replace
the crystal without removing the OSC COIL board
and found a method that seems easier than the one
suggested in the service manual.

I removed the metal shield next to the OSC COIL
board and disconnected the shaft coupler for the
band switch then pulled the shaft forward until I
could get to the solder connections on the OSC
COIL board. ** Make sure you don't rotate any of
the switch wafers** I un-soldered the old crystal
(you won't have to do this) and pushed the pins
through until the crystal was free of the board.

I cut a small piece of heatshrink to go around
the new crystal. Under the heatshrink I stuck a
few inches of tinned copper wire that I bent in
an "L" shape to allow me to feed the crystal
under the band switch and poke it's wires through
the board. It took about three minutes to get the
new crystal soldered in place. Once the crystal
was soldered in place all I had to do was slide
the wire out from under the heatshrink and the
job was done. The heatshrink remained on the
crystal but it's so small you can't even see it
under the band switch. I pushed the band switch
shaft back in and replaced the shield and the
hard work was done. After a coil pack adjustment
the radio is as good as new and I'm really happy with the results.

54600. TS820 PD board

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-28 19:52:29 UTC
From: john@...
Topic: 54600 Message: 54600

Greetings All from N.Ireland
I am in the middle of restoring a TS820, so far most of the problems have been overcome but I am totally confused by the PD board, I am not getting any VCO signal.
Have noticed that the VOF line is high and has therefore switched Q17 on the VCO board to earth which kills the VCO output this I understand is because the Phase comparator Q19 is not Locking ?
as I am an Old timer and totally useless as far as Digital Theory, can anyone offer any suggestions, or better still has somebody got any idea where I might get a used board,
Oh by the way the display is dead nothing at all, but I think this may also be because the COF line and the lack of CVC signal is causing the problem (I Hope!!)
Any help or suggestions greatly appreciated,
73

From: Alexander N. Gerli
Topic: 54602 Message: 54602

Hi, Folks! I just read a post about replacing the X8 crystal in the 29.5MHz bandswitch position. Just out of curiosity, I decided to turn my rig on and see what that bandswitch position read.....

Oh, Murphy, you done me wrong. Sure enough, my '820S has seen service on the CB band. With the VFO reading zero, the display reads about 27.352MHz. RATS!! This MIGHT also explain why my 20M and JJY/WWV positions are reading "19.000"......Now, I need a new crystal for that position. I looked through the Service Manual on Mark's site and found the list of crystals in the Parts List for the PD Board. I think it's X8, but not certain, and what frequency is it supposed to be? The band crystals X1-X8 have part numbers but really vague frequencies. Is it a fundamental, third-overtone, or WHAT?

I need to know where I can get a new crystal so I can put this right. Looks like I have some "brain surgery" ahead of mw, HIHI.

Topic: 54603 Message: 54603

Hello,

Perhaps this has been discussed already but I have difficulties in searching thru all the files.

Hopefully someone can get me into the right direction for this repair.
I just received a Kenwood TS-820 and the digital display is way off on all bands.
I have alreaady lubricated the shaft and bearings in the VFO which has corrected the intermittant display. :)
I have varified with another rig the display is incorrect but the TS-820 is correct as an analog rig.
==========
The digital frequency display shows:
True frequency in brackets.
10 Meters (29.787) shows 27.471
other 10 m bands are also displayed wrong.
15 Meters (21.287) displays 22.371
20 Meters (14.286) displays 18.171
40 Meters (7.286) displays 3.971
80 Meters (3.786) displays 1.871
160 Meters (1.909) displays 0.744
WWV (15.000) displays 18.600

Does the same in all band modes displays is too high and mostly displays out of band, but it actually tunes in band.
Any ideas on the digital display repairs?

Tony

From: Lou Blasco
Topic: 54603 Message: 54604

Hi Tony,

Most of the communication regarding display
problems mentions poor solder joints as the
leading cause. The information you have given
doesn't indicate a consistent frequency offset
and since you confirm the radio is otherwise ok
it is probably safe to assume you have an issue with the display board.

There are details in the service manual
explaining how the counter connects to the rest
of the radio. There are service bulletins in the
files section that mention display problems (redo
all the solder joints on the board) and if you
can find a copy of a document called "
TS-820-TechInfo3.pdf " there is a detailed
explanation of how the display works. I would
post a copy in the files section but I do not have upload permissions.

I'm afraid this will be standard troubleshooting
process which requires chasing the circuit and block diagrams.

Check the power supplies
Check all the cables connecting to the board
Check the signals on those cables are correct
(frequency, amplitude for RF signals) also DC levels for control
Check/refresh all the solder joints on the board

Lucky for you that the radio is working correctly
as this rules out many things.

Tony,
The "TS-820 Technical Information" document that Lou referenced is
located on my web site here:

http://wb4hfn.com/KENWOOD/Articles/TS-820-TechInfo3.pdf

The Kenwood Technical bulletins dealing with the DG-1 are # 26 & 53
in this set:

http://wb4hfn.com/KENWOOD/Articles/SERVICE%20NOTES%20-%20ALL%20HYBRIDS.pdf

Good luck with your trouble shooting. I've owned, I think 3 different
TS-820's and two R-820's and they all developed display problems and
all were fixed by doing the soldering referenced in these technical bulletins.

73's,
Mark, WB0IQK

  Tony,
The "TS-820 Technical Information" document that Lou referenced is
located on my web site here:

http://wb4hfn.com/KENWOOD/Articles/TS-820-TechInfo3.pdf

The Kenwood Technical bulletins dealing with the DG-1 are # 26 & 53
in this set:

http://wb4hfn.com/KENWOOD/Articles/SERVICE%20NOTES%20-%20ALL%20HYBRIDS.pdf

Good luck with your trouble shooting. I've owned, I think 3 different
TS-820's and two R-820's and they all developed display problems and
all were fixed by doing the soldering referenced in these technical bulletins.

54607. TS830S INTERMITTENT 60MA BIAS

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-29 17:34:02 UTC
From: hpdd709@...
Topic: 54607 Message: 54607

My TS-830S has an intermittent 60ma displayed in the meter. I've cleaned the bias pot several times. I also cleaned the send/receive switch several times.
IP seems to be quite staple when in the cw mode. I can get full power, good plate IP dips, good ALC. Plate voltage at 951 volts DC. The radios performs quite well with excellent reports of received level and good quality modulation.

I can lightly tap on the chassis and sometimes the 60ma will take a dive. I do not see a dive in plate current when in the cw mode, only when checking bias current. Out of 20 send/receive switches, maybe once will the 60ma take a dive.
Could this be a touchy RL1 relay on the AVR board?
Any suggestions or opinions would be greatly appreciated..

73,

Mike George K3MG

54608. Kenwood ts-820s not recieving, pegged s meter

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-04-29 04:06:37 UTC
From: paxtonwevans@...
Topic: 54608 Message: 54608

Sorry if this problem/solution is posted elsewhere, but I dont know where to go from here.

I have an ebay fresh 820s that will not receive (only noise). It shows signs of attempted repairs/neglect (missing screws on RF / PLL shields, sticky note calling one of the AND gates bad on the counter unit, mismatched finals) especially on the AVR board. The bandswitch has the plastic shaft coupler. and it is badly cracked.

I started by cleaning all switch contacts with DeOxit, and cleaned the internal pins/connectors

The shorting plug on the rear of the unit is installed. I also soldered a jumper between pints 8 and 9 while I am troubleshooting the unit.

I found multiple broken solder joints on the AF-AVR board, which also looks like had been repaired previously (lifted traces)

One thing that ive run into that confuses me is the 14 volt line going to the AF-AVR. With the AF-AVR disconnected and removed, the 14 volt line is fine. With it installed (all 4 screws tight) and plugged in, it drops to 12.82 on pin 3 of AF1. Is this normal or is something overdrawing the supply?

Reading through this group's messages I also checked the VFO from pin 1 of the external VFO connector with my scope. I received a clean sine wave.

Occasionally the relay on the relay board chatters (while in receive) and the S meter dives to 0 wile this happens. Another odd thing with the S meter, it will go DOWN when AF gain is turned UP. otherwise it is pegged while in receive.

Any help greatly appreciated!

Paxton, KE0ITR

54609. Need Replacement Mode Switch for TS830S

Hi:
I have been trying to repair a non-functional Kenwood TS830S. So far I have replaced two open resistors, one resistor that was three times the value it should be, and one choke in the plate supply line of the 12BY7A. My latest need is for a replacement Mode Switch (Kenwood part S01-3405-15). Two sections are giving various readings up to 50 ohms for contacts that should be shorted. I have been watching Ebay but have not seen any for the TS830S come up for sale, and none have beeen sold recently. Any help would be appreciated, will still watch Ebay in case one comes up.
Thanks,
     Don AK4UQ

Hi Don,

This is Walter Dilley. I have the Hybrid parts inventory to supply the
needs of those who wish to keep their Kenwood rigs running.
I have a mode switch, contact me at my address below.
Have you tried to clean the mode switch with DeOxit for example? It's not
always easy but changing the mode switch is not a cake walk either.

Thanks,
Walter, kd7dny

Good morning to all .
I need some advice
I have realized a negative power supply with 7909 to apply a voltage from 0 to -9 volts on Remote connector
TS-520 (ALC/Grond).

I connected the TS-520 to a dummy load.
I did the usual tune procedures , I read rf power output 120w .

At this point I switched on the power supply with negative voltage
always connected to a load Dummy
Switch Mode in CW
Frequency 7 MHz
And I read the following measures:

negative Volt Watt

0 volt 120
-2 volt 120
-3 volt 120
-4 volt 120
-5 volt 120
-6 volt 120
-6,8 volt 100 decreases
-6,9 volt 50 decreases
-7,0 volt 40 decreases
-7,1volt 22 decreases
-7,3 volt 10 decreases
-7,5 volt 5 decreases

Question:
Because from -2 volts to - 6 volt the RF Power does not decrease ??? , It is normal that the RF Power starts decreases from -6,8 v up

Thank you , to all

You can use a 6 volt lantern battery instead of the 9 volt battery.

54618. Re: Kenwood ts-820s not recieving, pegged s meter

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-01 02:19:50 UTC
From: paxtonwevans@...
Topic: 54608 Message: 54618

After being contacted by another ham I discovered I was confusing the AF and RF gain knobs. The S meter is no longer pegged.

However the problems persist. I decided to do some further troubleshooting on the 14 volt line. With the unit unplugged and HV caps discharged, I hooked up my ohm meter between the 14 volt pin on the rectifier board and the chassis. I recieved a reading of 53.3 ohms, which makes me suspect a short. Am I correct on this?

I unwrapped the 14 volt line from its post and supplied it with 14 volts from my bench power supply, negative of the bench supply going to chassis ground. I put an amp meter in series with this and turned the 820s on. It was drawing 450 mA. Is this unusually high?

With the unit unplugged and HV caps discharged, I re-wrapped and soldered the 14 volt line to the rectifier board and reconnected my ohmmeter between it and chassis ground, getting the same 53 ohm reading. I then set about unplugging and reconnecting the connectors everywhere on the unit to see if any would cause a change in resistance. connector RL-1 on the relay board caused the reading to go over 10 megohm.

Going off the schematic provided at: http://www.iw2nmx.it/Kenwood%20-%20Trio/TS-820S%20Instruction%20and%20Service%20Manuals/TS-820S%20Schematics.pdf http://www.iw2nmx.it/Kenwood%20-%20Trio/TS-820S%20Instruction%20and%20Service%20Manuals/TS-820S%20Schematics.pdf I removed wires 8, 9, 10, 11, and 12 from the RL-1 connector and re-connected it to the relay board after disconnecting each one. With no change in reading form 8, 9, 10, and 11, I would reinstall them into the connector before proceeding.

12 however seemed to be the culprit. With wire 12 removed, the resistance from +14 pin of the rectifier board to chassis was greater than 1 megohm. But now my question is where the heck does wire 12 go to? It is white. In the schematic they seem to be going to CH 1, I have no idea what that is or what it stands for....

also, the relay chatter seems to be somehow related to the speech processor. it will cycle on for a second when the processor knob is turned on or off. Seeing the extensive damage to the AF-AVR board, I opted to order a new one.

Am I headed down the right path or am I chasing my tail?

Paxton, KE0ITR

From: TS-520_820_530_830@yahoogroups.com
Topic: 54481 Message: 54619

Welcome to the Yahoo Kenwood TS-520_820_530_830 Amateur Radio Group. This group is comprised of members who's interest is in maintaining and operating the Kenwood TS-520, TS-820, TS-530, TS-830, TS-510, TS-511, T-599/R599 and R820 Hybrid transceivers, transmitter and receivers. In addition, the group supports discussions covering the associated Kenwood accessories such as the VFO-520, VFO-820, VFO-230, and VFO-240 remote VFOs, the Kenwood antenna tuners, and the various Kenwood desk and hand microphones.

This is a restricted group requiring membership approval prior to receiving and posting messages to the group. To join the group simply complete the Yahoo Kenwood TS-520_820_530_830 Group's application process by clicking on the “+ Join Group” icon on the group's homepage. Select the desired method of receiving messages by clicking the appropriate radio button, then provide a brief description about yourself to include: your first name, your Amateur Radio call sign, your interest in the Kenwood hybrid radio, and the model of Kenwood hybrid you own, operate, or in the process of purchasing in the text box provided. If you are not a licensed Amateur Radio operator, no problem, simply complete the application process and provide the same information less the Amateur Radio call sign. Once you have completed the text, click the Join Group icon. Your application will be reviewed and approved by a group co-owner or Moderator. If you leave the application text box blank, your application for membership will be rejected. Simply reapply and provide the information requested and resubmit your application for membership.

New members are placed on a "Moderate" status. This means that any message a new member posts to the group must be approved by a group co-owner or Moderator before it appears on the group server for all members to see. The length of time a new member remains in a "Moderate message status" is determined by the members ability to adhere to, and follow the group's policies. The faster the new member(s) can prove they are adhering to, and following the group's policies, the quicker the new member's status will be changed to “Allowed”.

The “Allowed” status means the member can submit/post their messages without group co-owner or Moderator's approval. A member who's message status is set to “Allowed” may have their message status changed to "Moderate" if it is deemed necessary by a group co-owner or Moderator for one of the following reasons:

1. Failure to follow the group's policies after being informed by a group co-owner or Moderator
2. Knowingly violate any of the group's policies
3. Any improper behavior by the member that is deemed inappropriate by a group co-owner or Moderator

The group is moderated by both group co-owners and group Moderators. While we would like to have a group co-owner and/or Moderator present 24/7, that is not possible, as group co-owners and Moderators have a life too. Therefore, there will be times when a group co-owner and/or a moderator will not be present. This will affect the time a moderated member's messages may take to get approved/rejected. This occurs most often during major holidays Also, the group's server is not maintained by the group co-owner(s) or Moderators.

Therefore, when Yahoo has problems affecting Yahoo Groups, ALL members will simply have to wait for Yahoo to fix the problem. Group co-owners and Moderators also do not have any control over how the group's server handles attachments to messages or how message search results are provided.

Page 1

As stated above, this group has a set of policies that all members must agree to and abide by. If any member, new or old, that feels they cannot accept the group's policies, that member is free to terminate their membership at any time without notifying the group co-owners and/or Moderators.

Group's Policies:

1. Profanity of any type, regardless of the word and/or phrase(s) used in a message, is not allowed. This includes the use of abbreviation to improper words, use of symbols to substitute for letters, etc. In short, the use of profanity is NOT ALLOWED, PERIOD!!! The quickest way to get banned from this group is to use profanity!!!

2. Disrespect/Flaming any member regardless of the reason, is not allowed.

3. Taking over a thread by a member that changes the threads original subject and content, is not allowed.

4. Messages that contain as part of the message text, discussions of a member's private life are not allowed. Responses to messages are to pertain to the original message subject.

5. Long discussions that are products of an original messages are not allowed. If there are 2 or 3 members who wish to discuss a subject in more detail and at great lengths should take their discussions off the group and continue their discussions using private email addresses.

6. MESSAGES THAT DO NOT CONTAIN ACCEPTABLE MESSAGE SIGNATURES, WILL BE SUMMARILY REJECTED! It takes less than 5 seconds to ensure your message contains an acceptable message signature. There is no excuse for not adding a message signature to your messages. Political or religious signatures/statements are not permitted.

The following are examples of the ONLY acceptable message signatures:

Licensed Amateur Radio members:

Example:
“73s
John WA1ABC”

Non-licensed members

Example:

73s
Mary

If a member does not wish to include their Amateur Radio call sign in their signature, then simply use their first/given/Christian name ONLY, same as non-licensed members.

Each message signature must be positioned at the bottom of the message text and separated by at least one line.

For example:

Hi John,

Yes capacitor C25 is the right cap you should be checking. For details, review the schematic.

73s
Bill

Screen names such as JLH524 or MWPO125 are not acceptable message signatures. Screen names are acceptable ONLY when used as part of the member's email address.

The member's email address is not an acceptable message signature, regardless whether the member's name appears in the email address or not.

A member's “initials” are not acceptable as a messages signature.

A member may add up to 2 additional lines to their message signature. The additional 2 lines may contain a link to the member's website and a link to the member's Amateur Radio club etc. The addition of 3 or more lines to the message signature, listing the many different clubs the member belongs to, the positions they hold within the respective club(s), their professional position within the company the member works for, and other information is considered excessive and not allowed. The following is an example of an acceptable message signature containing two additional line:

73
Mike-w5rkl
www.w5rkl.com
Yahoo Kenwood TS-520_820_530_830 Moderator (Mike-w5rkl is no longer a Moderator, but used as an example--tnx)

In the past there have been members who state our group policies are too strict. We maintain strict group policies for 2 simple reasons:

1. To maintain good order and discipline in the group.
2. Provide a friendly group where all members are treated equally and an environment free of improper behavior

73
Yahoo Kenwood TS-520_820_530_830 Hybrid Group Co-owners and Moderators.

Rules pertaining to Occasional For Sale and Want to Buy Posts.

Members of the TS-520_820_530_830 Yahoo Group who have been members for at least 30 days may place " for sale" posts no more frequently than two in any 30 day period." Want to buy" posts are permitted immediately upon membership and are limited to 2 in any 30 day period.

For sale posts are limited to the sale of TS-510, 515, 520, 820, 530, 830, and the 599 series twins, as well as Kenwood accessories intended for use with these radios.
Also, group members may post "service equipment" for sale. This may include, but are not limited to: vtvms, various signal generators, and other testing/service equipment. Posts must include: the make and model of the item for sale, as well as an accurate description of its condition, and the asking price.

When the item is sold, please make a short post to that effect.

Replies and discussions regarding these posts must be taken off of this group either by direct e-mail to the seller or as directed by the seller.

Buyers and sellers are on their own. The TS-520_820_530_830 Yahoo Group, its owners, co-owners, moderators, or members other than the seller, hold no responsibility for the accuracy of the posts or the credibility of the seller or buyer.

We do not expect that members of this group will misrepresent, or in any way cheat other members. At the co-owners(s)/moderators discretion, we may choose to ban any member from making further for sale posts, or ban the member from this group entirely if we believe their posts or transactions are not of the utmost integrity.

We ask that those who buy and sell equipment as a main business not post here. We will allow posts from members who occasionally restore and sell equipment/accessories as stated above.

We expect our members to use discretion. If excessive traffic develops as a direct result of these postings, they may have to be discontinued.

Walter Breining, N9WB
Joseph T Stiles, WB7UQU

Frances:

Yes it is normal.

Look at the schematic at the Remote connector and you can see why.

You will see 2 diodes in series in the ALC voltage input line. One is a silicon diode the other is a zener. When you place diodes in series in a power supply you reduce the voltage available for the load similar to what would happen if you used series resistors. In this case the ALC buss/rail presents a very high Z load to your new auxiliary power supply that you are placing in parallel with the buss fed from RF-1 power supply. This means that there will be very very low current flow to the Gate of the TIF amp (in the low ua range). The ALC buss has to supply no current just a variable dc control voltage to control the gain of the TIF amp.

The silicon diode has approx constant 0.6vdc drop and the 9.0vdc zener will have a reverse voltage significantly lower than the rated value at the ua current levels involved.

If you had a very high Z voltmeter (on the order of 100meg or more) you could place it on the ALC buss and monitor the voltage as you slowly raise the voltage from your - 9vdc supply that you are inputting at the Remote jack (you can use a 10 or 11 meg meter but must realize the loading effect the meter will have on the buss voltage).

Assuming that RF-1 has been adjusted for +3.2vdc you would see that the standing +3.2vdc control or servo voltage remains at +3.2 vdc until you get to around -5.0vdc and the buss voltage would just start moving downward. At approx -5.5vdc the buss would be down to +3.0vdc. At -6.0vdc the buss would be down to around +2.8vdc. At each step reducing the gain of the TIF amp.

As you continue raising the negative power supply voltage that you have paralleled up with the ALC buss the positive voltage would continue downward reducing the available control voltage at the Gate of the TIF amp and lowering the TIF signal level supplied to the TX Mixer on the RF board. Which in turn reduces the RF drive from the Driver tube to the Finals. At approx -9vdc the ALC buss voltage would be just a couple of tenths positive and virtually no TIF signal from IF board to RF board and no RF drive to the Final tubes. So it takes approx -9vdc for the series dropping effect of the two diodes to present -3.2vdc to the +3.2vdc powered buss/rail which results in net buss voltage of near Zero.

So it is normal for the "power reduction" to be compressed from approx -6vdc to -9vdc. If you want more fine control you might try a multi-turn pot.

Terry K9TW

Hi
Dear All
Also in SSB, from 0 to -6.7 rf power is not reduced.
from 6.9 to -7.5 rf power is reduced,
as indicated in the initial table.
Anyone has tested this system, controlling the negative volt output ????.

Hi Sandy,KØPSA here. I had issues with my TS-820S display which began acting up and eventually failed. I pulled the DG-1, took apart and rather than re-solder anything I first tried running a large pipe cleaner soaked in De oxit through the thru holes several times. Put it back together and it's been working properly since. Maybe I was just lucky but it worked for me.73ButchKØPSA

54627. Hybrid Net Update (May 1, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-01 21:09:27 UTC
From: Mark Gilger
Topic: 54627 Message: 54627

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Saturday net was run Jimmy, WB2KNR. There
were 22 stations checking in under good
conditions. There were 2 new station checking in: WB9WHO, and AC1Y.

We had the following number of radios checking in.

3 running TS-520(x)
2 running TS-530(x)
5 running TS-820(x)
6 running TS-830S
0 running TS-510
0 running TS-511
1 running TS-515
0 running 599 twins
1 running TS-900

I was running my TS-830s and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
11 stations checking in under good conditions.

We had the following number of radios checking in.

3 running TS-520(x)
1 running TS-530(x)
0 running TS-820(x)
4 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,

although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 ☐ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday☐s net total = 66, Sunday☐s total = 46
December 2015, Saturday☐s net total = 55, Sunday☐s total = 73
January 2016, Saturday☐s net total = 129, Sunday☐s total = 81
February 2016, Saturday☐s net total = 98, Sunday☐s total = 72
March 2016, Saturday☐s net total = 74, Sunday☐s total = 35
April 2016, Saturdays net total = 101, Sundays total = 57 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo

Hi

I have a TS-520 and I had this problem before, just not this bad.

I flip the meter to ALC and Mode to TUNE. If the radio is cold then ALC works. But as the radio warms up ALC sometimes drops to zero when I am tuning it. I am trying to peak ALC and suddenly it drops. And when it drops it stays down until I leave it to cool down.

I am suspecting it's bad driver tube. What do you think?

Hi, folks. Oh, brother, am I embarassed. I posted that my DG-1 had quit after I'd cleaned all the edge connectors. Well, Murphy visited the shack. I have a VFO-820, and I'd forgotten to put back the Pin 8-9 shorting wire in the Accessory socket after I'd unplugged everything. BINGO, everything came back, but the display is STILL not working correctly on 20M or WWV

It is almost like there's inadequate VFO drive to mix with the counter on that band. But, I can load up fine on 20 and the RX works great, so I'm not sure WHERE to look. The Service Procedure for the Display doesn't mention any band-specific adjustments. So, where do I start tracing this display error?
Hope someone the List can help me out.

I had the problem that the counter counted backwards or got blank on
some bands. Counting backward means that when turning the VFO from 0 to
500 the counter followed until eg. 300 and than started to go down again.

After checking and adjusting the VFO output (was too low....) the
problem went away. RX/TX was fine all the time. There is one step in the
service manual describing how to check and set the VFO output voltage.

Martin

54631. DG-1 repairs

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-02 18:27:29 UTC
From: Alexander N. Gerli
Topic: 54631 Message: 54631

Hi, folks. Thanks for the responses. I have a magnifying headset and a very thin tip for my Weller station which has an adjustable temp; it's a 40W pencil.

Apart from reflowing the through-holes, I wonder about something: the display error ONLY occurs on either 20M or WWV. So, I wonder whether the problem could be related to a mixing- or driver- voltage on just THAT band? Since 20M hears and loads just fine with the VFO, the voltage error couldn't be far off. I have tried to DeOxit the Bandswitch contacts for 20M, but I'm not certain I got the stuff in the right place (it is VERY tight in there, after all).

Also, I note that on one of the DG-1 boards, there are several tunable iron cores. In the Service Manual instructions for the DG-1, these cores are not referred to in any way. Might these require adjustment? I won't dare touch them unless someone on-list refers me to them.

Thanks again for your assistance, much appreciated!

Sandy,
All the bandswitch wafer contacts should be readily accessable, except for the ones under the driver tube. Since you state that 20M rcvs/xmts ok, and just the digital readout is malfunctioning suggests that the DG-1 is at fault. See Pg 40 of the Service Manual. You can also check for proper voltages by looking at item 5-2 on Pg 52 of the Service Manual. Since other bands seem to indicate properly, I doubt that the counter input level is off, but you can look at item 3-2 on Pg 49 of the Service Manual(these are the "tunable iron cores). Check and clean every pin, connection, and look at every trace on both the boards of the DG-1 unit....use BRIGHT light and Magnification. It is recommended that when repairing the through holes or "vias"...also use some spare wire snipped from some parts drawer resistors/caps...etc...and insert through the hole when reflowing.

I performed the mod on my TS830S to the AF-AVR board to eliminate frequency jumping or warble when touching the VFO, by placing lock washers on the board to ground and a jumper from the TPG post to ground as detailed in the service release.. I also pulled the VFO assembly and removed the shield can and leads to check the gears. All was well, so I put it back and checked all the connections.

While that solved the freq warble problem, I now find the display readout doesnt change even as the frequency itself is varied. Also when changing bands, the display stays on the previous band. Only when turning off the rig does the display show the proper band but incorrect frequency. I removed the mod with no change of the above. I pulled all plugs and reseated to no avail.

Im stumped. Anyone have any suggestions?

54639. DG-1 reflow results

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-03 20:57:32 UTC
From: Alexander N. Gerli
Topic: 54639 Message: 54639

Hi, folks! Well, I took some serious time with my magnifier and pinpoint iron, to reflow all the through-holes I could find on only the digital board, and also resoldered the Molex sockets. Reassembled it and the result isn't nice. Now, I show a leading "9" in the Units MHz place on each band, although the hundreds KHz and tenths still count normally. 20M and WWV still show "19.000.0" and don't count, as before, and the bands above 20M show "29.xxx.x". Something isn't dividing(?) somewhere now. I'm not digital-smart, so I don't know which IC could be the culprit. I'm at a loss now. I was very careful and didn't create any solder bridges or lift any foil. I heated every through-hole well to make sure the solder went all the way through (showing a small blob on the opposite side).

Hope someone on the List can help me with the next step I can try

73,

Sandy AC1Y

> Sandy AC1Y

Did you remove the old solder (with a vacuum de-soldering pump or suction bulb) and put new solder down instead of just using the old, probably oxide-contaminated solder?

Did you slip a piece of wire into each via / "through-hole," something like a snippet off of a resistor or capacitor lead, to make a more solid connection with the new solder and both sides of the board?

I think there have been a few (several) threads on this board with this same procedure delineated, wire inserts and cleaning the holes of old solder.

For those attending this years Dayton Hamvention.

We will be having another Kenwood Hybrid forum
Saturday, May 21, 1:15PM - 2:15PM.

The agenda will be:

☐Agenda:
☐VFO Delayed Power On Modification
☐TS-900 & TS-511 restoration
☐Band Switch Repair
☐TS-830 CW Filter Option
☐Final Unit Cathode/Screen grid protection
☐TS-830 Low Audio, Sloppy Band Switch
☐RF Board Cracked RF Board Sprockets
☐VFO Stability
☐TS-820S Digital Display
☐Hybrid restoration Techniques
☐Help with Parts, Documentation & Service
☐Questions and Answers

See you there.
73's,
Mark, WB0IQK

54642. Re: [TS-520_820_530_830] DAYTON HAMVENTION

Yahoo group: TS-520_820_530_830 (2015 — 2016)

54643. TS-820S Birdies

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-04 15:07:59 UTC
From: J Evans
Topic: 54643 Message: 54643

I wrote here before about "Birdies" in my TS-820S on 40 M and got some good direction. I have pinned the source down to the ethernet port on my HP M277color laser printer. If I disconnect the network cable at the printer the printers the "Birdies" go away. I've tried a few things but I can't seem to quiet that port down. Any suggestions out there"

Topic: 54643 Message: 54644

Hi Jim,

You said you tried a few things but you didn't
say what they were. However you have established
that the source is the printer and more than
likely the interference is radiated from the
ethernet cable. So the aim is to stop the
radiation from the cable or change the
configuration so the radiation goes away.

You could try one of those snap on cable chokes
but I've only found them effective in cases of
mild interference. If that doesn't work try
looping a number of turns (as many as you can) of
the ethernet cable through a bigish (2" to 3")
ferrite toroid making sure the toroid is as close
to the end of the cable as possible. This means
your choke will be right up hard against the back panel of the printer.

The best result I've had is to force network
ports to work at 10mb/s rather than 100mb/s. I
don't know anything about your HP printer but
perhaps in the menus there is a speed setting for
the ethernet. If there is no speed setting in
your printer the other way to do it is to look
for an old 10mb/s hub and daisy chain it off your
main hub then connect your printer to the 10mb
hub. In this way you force your printer to slow
down and hopefully get rid of the birdie.

The other possibilities are to turn your printer
off when on 40m or connect the printer to your PC via USB.

Hello name is Richard and my beloved 520S just smoked C60 on the RF section pcb near the driver tube. No other parts smoked except C60. It was idle and I had just flipped on the heater switch. Began to smell smoke about min later. I posted a picture of it. Any thoughts on why before I start trouble shooting later this evening?

Greetings all-

Will share this short note regarding Kenwood parts. It applies to the MC-50 microphone. During the heat of the Virginia QSOP, the PTT spring in my MC-50 decided to go south. Managed to find one on eBay for 9.99, free shipping. The spring looks a little like a paper clip bent out of shape with an attitude. Anyway, I found this company in California who handles Kenwood parts. Found a detailed description of all parts for MC-50, but as I looked down the list of parts breakdown, I started seeing, "Discontinued. discontinued", etc...till I got to the spring....$2 each!. Long story short, got 4 of them with shipping @ 4.95. Total 12.95 or about 3.24 each. I referred another fella to the site who was looking for the black cradle that the MC-50 mic sits in....he found it at this site.

Name of company is PACPARTS.COM As a side note, I was also looking for plastic frame for car after market radio, they had it.

Not sure if you want to include this in your list of Jenwood parts references or not, just passing it along.

Randy,

PacParts is already included in my Service &
Parts document that is kept on my web site.

It's good to know they still have a few items.
I'm always looking for places that still have
parts so we can add them to the list as this
stuff is just going to get harder and harder to find.

I just got through tracing the circuits (after replacing the smoked 0.047uf C60 cap) and noticed it also took out both ten ohm and one of the 100 ohm final resitors. This unit was idle heaters and hv on connected to a dummy load not transmitting when this happened. Lucky for me I had previously replaced those with modern flame proof metal film. The resitors in the final section are not smoked or discolored at all. One of the 100ohm had a tiny chunk blown out only.

Sandy,
The board you seek is inside the PLL ASSY X-60-1010-00. On underside of the rig it's the big rectangular box with all the holes in it. It's a pain, but do your self a favor, remove the AF-AVR unit and the RELAY unit, this WILL make it easier to get the PLL ASSY out AND back in...trust me on this! While you're at it...clean the connections...and make sure to record/mark the location of all the connectors.

Richard:

That is an unusual failure. C60 in conjunction with L8 is a low pass filter with a cut off around 1.5 mhz. It normally wouldnt see very much RF cuurent. It does see 60hz.

I would look at L8 choke to make sure the clear plastic tubing over it hasnt melted.

I would also pull the Driver tube and measure continuity between the Heater and the Cathode pins. Should be infinite.

Hopefully the associated pc pad and traces are not hurt. You can view them from bottom side of the board. Should see where the Purple Heater supply lead is landed on the terminal post on the foil side of board to get your eyes on the involved area.

I think today an ac rated cap like a Y4 would be used in this decoupling application.

Topic: 54646 Message: 54654

I would not use those Final tubes again.

An arc over normally occurs between the Anode and the Beam Forming Plates (cathode) which is the physically closest element.

This sounds like you had very high current thru the Screen Grid stopper resistors and the tube filament winding. Normally you should read infinite between the anode and the screen grids and filament. As point of interest might want to measure continuity between all of the final tube elements. Only the cathode and beam forming plates should ring.

Also, if you blew a hole out of a SG stopper then there was heavy fault current back to the SG supply. I would want to exam that path as well. Begin by looking at L2 on Final board and work way back thru SG switch to the HV Unit board.

Not common for the control grid to be involved in an arc over event, but need to check that path from Final board back to RF board and the ALC circuit and bias voltage adjust pot and back to the -C supply.

It will be very good fortune if no damage elsewhere.

Hi Everyone!

I'm a very new ham, and consequentially very new to hybrid radios, too. I've owned my TS-830s for around six months now, and it's been working alright as far as I could tell. The other day I was trying to check mail through Winlink. I started the session and my radio began transmitting, I saw the waveform on the SM-220 and was looking at everything to make sure it was right. Next thing I knew the waveform was flat. There was no sound, no electrical smell. It went from working fine to not working at all. I checked my tuning and discovered that there was no drive. The receiver end of things still works fine.

I replaced the driver tube, but that didn't fix the problem. I started going through the "Adjustments" in the service manual. I got all the way to Item 2, Base current adjustment. This is where you set the bias to 60mA. For the full rotation of the Bias VR nothing registers on the meter.

I'm very new to electronics, (despite having worked with computers for years). I'm planning on taking the Extra exam next week, but I still have no clue where to proceed next to find the source of the problem. Any suggestions would be greatly appreciated.

Thanks in advance,

Robb KE8CEL

From: Mike W5RKL
Topic: 54660 Message: 54662

Robb,

You said the "IP" meter is resting at "zero" when it should be indicating "60ma". If that's what you see, I suspect all four 20 ohm 1/2 watt final amplifier cathode resistors have burnt OPEN.

The 6146 cathode is the common return path for ALL currents flowing in the 6146s. If the cathode is "Open" then there is no return path for current flow in the 6146s, hence the IP meter rests at zero.

Remove the AC plug from the wall outlet, remove the top and bottom covers, and turn the 830 upside down with the final amplifier to your right. Look for the four 20 ohm cathode resistors. If they look "Overheated" and burnt, then use an ohm meter and connect the ohm meter across one of the resistors. If the ohm meter display "infinity" then all 4 of the cathode resistors must be replaced.

You can use Metal Oxide 20 ohm 1/2 watt resistors as replacements. You can find them at

www.mouser.com

Cut the P/N 660-MOS1/2CT52R200J and paste it into Mouser's "Part #/Key word" search box and click "SEARCH". The page will come up and provide you with specification information and price. Below is the P/N, Price, and quantity Mouser has on hand for 1/2 watt 20 ohm Metal Oxide resistors:

Mouser P/N = 660-MOS1/2CT52R200J
Price = 10 cents each
Qty on hand = 1,713

Assuming that all 4 cathode resistors have burnt open, replace the 4 cathode resistors then test the 830 for proper operation. Use caution when servicing your 830 as there are AC and DC voltage in the 830 that can KILL YOU!!!! If you do not feel comfortable performing the resistor replacement then I recommend you find a local ham who has the experience that can help you replace the final amplifier cathode resistor.

54663. Re: [TS-520_820_530_830] Re: TS-520S RF section repair

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-08 19:22:57 UTC
From: Mike W5RKL
Topic: 54646 Message: 54663

Richard,

The TS-520 final amplifier cathode resistors acting as fuses? The cathode resistors are not nor do they act as fuses. Resistors make horrible fuses. Yes there are "Fusistors" but the resistors in the 6146 cathode circuit are NOT "Fusistors", they are normal 10 and 20 ohm resistors.

There is also a belief that improper tuning of the KW hybrid's final amplifier will cause the final amplifier cathode resistors to blow. Not true. The following is an explanation that shows why.

I will use 2 rather high 6146 cathode current levels, one at 350ma and one at 500ma, during this discussion. For this discussion I will assume the cathode resistors are 10 ohms 1 watt and are within 5% tolerance.

Using Ohms Law we calculate the final amplifier cathode voltage with 350ma of cathode current. To do that we use the Ohms Law formula:

E = I x R

Where
"E" is the unknown cathode voltage
"I" is the known 350ma cathode current
"R" is the known 5 ohms of cathode resistance

The 6146 cathode voltage, measured from pin 1 to chassis (ground), will be approximately +1.75VDC.

.350 x 5 = +1.75VDC

We now can calculate the approximate power dissipated in the final amplifier cathode circuit:

P = I<sqrd> x R

Where
"P" is the unknown power dissipated in the cathode circuit
"I" is the known 350ma cathode current ("<sqrd>" means .350 multiplied by itself)
"R" is the known 5 ohms of total cathode resistance

.350 x .350 x 5 = .6125 watts

Notice the power level is just "slightly" over 1/2 watt. To find out what the power dissipation level, in watts, in each 10 ohm 1 watt cathode resistor, simply divide .6125 by 2:

.6125 / 2 = .30625 watts (dissipated in each 10 ohm 1 watt cathode resistor)

You can also use individual steps using Ohms Law to find the same answer.

First, what is the current flowing in each 10 ohm cathode resistor with
+1.75VDC cathode voltage?

1.75 / 10 = .175 amps

Next, calculate the power dissipated in the 10 ohm 1 watt resistor:

.175 x .175 x 10 = .30625 watts

Same answer.

We increase the 6146 cathode current to 500ma. We use the same formulas.

Cathode voltage at 500ma of cathode current is +2.5VDC

.5 x 5 = +2.5VDC

Current through each 10 ohm 1 watt resistor with +2.5VDC cathode voltage
is .25ma

2.5 / 10 = .25 amps

Power dissipated in each cathode resistor is .625 watts

.25 x .25 x 10 = .625 watts

Notice again, at this outrageously high cathode current level of 500ma,
the power dissipated in each 10 ohm 1 watt cathode resistor is only
"slightly" above 1/2 watt!!

Is it possible the 6146 cathode resistors fail, burn open due to age
during transmitter tuning? Yes it is possible.

I have a video on my website where I discuss how the TS-520/820 and
TS-530/830 IP meter circuits work in conjunction with the 6146 cathode
resistors. The links to the videos are as follows:

TS-520/820 IP meter circuit
http://w5rkl.com/wp-content/uploads/2014/03/TS520-and-TS-820-Cathode-circuit-calculations.
wmv

TS-530/830 IP meter circuit
http://w5rkl.com/wp-content/uploads/2015/02/TS530-TS830-Cathide-IP-meter-circuit.wmv

I'm sorry for the length of the response but explaining using Ohms Law
math calculations can take up some space.

I said at the end of my response:

"/*Is it possible the 6146 cathode resistors fail, burn open due to age during transmitter tuning? Yes it is possible."*/

I left the following off of the above statement:

/*"but not simply due to*//*improper transmitter tuning!"*/

Hi John,

This is Walter Dilley. I have a collection of parts that I call the "Kenwood Hybrid Inventory." I have parts for the 520/530/820/830 radios. I have PD boards. Send me an email and let's discuss what I have that may help you to fix your radio.
Many members on this list have been helped with this resource of parts.

Thanks,
Walter, kd7dny

From: illegitumusnoncarborundum@...
Topic: 54660 Message: 54667

Thanks for the very quick response, Mike.

I've checked with two different meters and get the same reading each time from all four resistors; 5.1 ohms. And to be specific, I'm checking R2-5 on the Final Unit. To be able to actually see the resistors, I have to take out one of the 6146B's. There doesn't appear to be any physical damage to any of them. Since I wouldn't be able to get a probe in there, I checked their resistance from the underside of the Final Unit board with the radio upside down (and unplugged).

I'm confused as to why I'd get a 5 ohm reading for a 20 ohm resistor. They are all red, black, black, and gold banded, so they are the correct value.

Thanks again,

Robb KE8CEL

Robb,
You say when you connect your ohm meter across one of the 6146 cathode 20 ohm resistors wired in parallel you see "5.1 ohms".You also said when you disconnect one 20 ohm resistor lead and connect your ohm meter across that single 20 ohm resistor you see 20 ohms. That's what you should see in both measurements. I have a video on my website where I discuss simple parallel resistor circuit.
http://w5rkl.com/wp-content/uploads/2014/03/Parallel-Resistors.wmv
I also have a video where I discuss series resistor circuits.
http://w5rkl.com/wp-content/uploads/2014/03/Series-Resistors.wmv
You might take some time and watch both videos.

Have you checked the rear panel SG switch to ensure it is in the "ON" position? If the SG switch is set to OFF, a "negative" DC voltage is applied, from the Rectifier Unit's "-C" supply, through the Rectifier Unit's RL1 relay to the final tube screens, pin 3 on either 6146 tube socket. This will result no IP current indicated in transmit. If the SG switch is in fact set to OFF, you will still see a peak ALC indication in TUNE mode but you will not see any IP current. Why? Because a negative DC voltage applied to the 6146 screens will repel electron flow to the screen and plate, back to the cathode but it will NOT repel any electrons that flow between the 6146 cathode and grid (grid current). Check the rear panel SG switch. Also check the 6146 screen voltage, pin 3, it should be with the SG switch set to ON, approximately +265VDC in receive and slightly less in transmit.
If the 6146 pin 3 screen voltage is zero, the same symptom, loss of IP current (same symptom as if the SG switch was set to OFF), will occur as the screen are "negative" in respect to the plate, repelling any electrons that flow from the cathode to the screen and plate.
If the relay on the AF Unit goes bad, which is can over time, the final amplifier grid voltage can be affected, doesn't change. If the 6146 pin 5 grid bias voltage remains constant at approximately -100VDC in both standby (receive) and transmit, the 6146 final tubes will remain cut off, no current will flow, resulting in the IP meter resting at zero. Check pin 5 on the 6146 tube socket. In standby the 6146 pin 5 bias voltage should be approximately -100VDC or so, dropping to -65VDC in transmit.

Subject: [TS-520_820_530_830] Re: No Drive, No Clue

  Thanks for the very quick response, Mike.
I've checked with two different meters and get the same reading each time from all four resistors; 5.1 ohms. And to be specific, I'm checking R2-5 on the Final Unit. To be able to actually see the resistors, I have to take out one of the 6146B's. There doesn't appear to be any physical damage to any of them. Since I wouldn't be able to get a probe in there, I checked their resistance from the underside of the Final Unit board with the radio upside

down (and unplugged).
I'm confused as to why I'd get a 5 ohm reading for a 20 ohm resistor. They are all red, black, black, and gold banded, so they are the correct value. Thanks again,
Robb KE8CEL

Not true!!! Two resistors of the same value in parallel should indicate
a combined resistance equal to 1/2 of either resistor. In other words,
two 20 ohm resistors in parallel should read 10 ohms.

Lee,
What I said is true.

It is true IF there are only "2" resistors of the same value connected in parallel such as in the TS-520 and TS-820 which have 2 10 ohm 1 watt resistor connected in parallel across the 6146 cathode to ground (pin 1 to ground). The formula for that is:

R1 x R2 / R1 + R2 = Rt
Using 2 10 ohm resistors connected in parallel:

10 x 10 / 10 + 10 = 5
which is the same as
100 / 20 = 5
However, the KW TS-530 and TS-830 have "4" 20 ohm 1/2 watt resistors connected in parallel, not 2. Therefore, connecting an ohm meter across the 4 20 ohm resistors connected in parallel will display 5 ohms not 10 ohms (1/2 the value of a 20 ohm resistor).
The formula for calculating 3 or more resistors in parallel is:

1 / 1/R1 + 1/R2 + 1/R3 + 1/R4 = Rt
The portion of the formula performed first is:
1/R1 + 1/R2 + 1/R3 + 1/R4
which is in this case using 4 20 ohm resistors in parallel:

.05 + .05 + .05 + .05 = .2

Next the second part of the formual
1 / .2 is performed to obtain the final answer of "5" ohms

1/.2 = 5 ohms total resistance

or one can, if all the resistors are the same value, use the formula:

20 / 4 = 5
If one lead of only one 20 ohm resistor is lifted, that single 20 ohm resistor is no longer in parallel with the other 3 20 ohm resistors. Connecting an ohm meter across that single 20 ohm resistor will display "20 ohms" on the ohm meter not 10 nor 5.

Robb:

You are correct that the Cathode resistors and SG stoppers are not located on foil side of the Final board.

To view them must remove the front final tube and shine decent lite like a mini-mag down on the board and look at an angle.

Eyeballing isnt best way to assess condition as they can look pristine and be drifted high or even infinite. Of course if the bodies are swollen or discolored and still read 5 ohms I would replace them. I usually replace them as they are carbon comp and hygroscopic and eventually will drift high. Dont worry about little inductance increase that metal film will present. Always replace all four. Also, try to view the area immediately under the resistors at the PC board surface to make sure there are no carbon tracks or paths. Not unusual to have a burned black and deep scorched paths under the resistor bodies and if so I would not attempt to scrape or grind it out. Best to contact Walter Dilley and replace the Final Board.

To replace them DO NOT unwrap the blue Drive lead wire from its wire wrap terminal post. Go to the RF board with radio on its side and grasp that lead wire at it solder pad at VC-3 with needle nose pliers and unsolder it. Now remove the Ant TR relay and you can carefully fold the Final board over. Before doing any of this I would unsolder all 6 resistors while you have the board hold down screws securing it. Sometimes the resistor lead wires are folded over so be careful not to lift a foil.

When done make sure you have snugged all the mounting screws and retack blue Drive lead wire at VC-3 solder lug. The screws are fine thread so dont strip them, but make sure tight. I see plenty that are finger tight and the cathode current ends up loosing the multiple parallel ground return paths and may even end up with a badly blackened screw or two that were doing all the work.

The more I look at this the more I am forced to the conclusion that somehow I must have flipped the transmit switch when I flipped the heater switch. I've already ordered the resistors and driver I am trying to get to a music amp shop to test the final tubes but in the mean time I'm probably going to just order the 6146b or /w finals as well they look overall higher rated then the 6293s I was looking at. ouch

Greetings

Has it been determined that we are getting any drive to the PA'S ? Check the output of the 12BY7A With a scope. there is a blue wire that goes to the pa's it attaches on the foil side of rf unit that is routed to the pa's through the circuit board.the tuning capacitor is closes to the rf cage. Mine had came off and I did not have any DRIVE to my PA's NO ALC.

If I understand you correctly, you must mean the blue wire that comes out of the bottom of the RF Unit, beneath VC3. In the board view of the service manual it's labeled DRV. It is connected to a terminal labeled DRV on the final unit. It is attached like it's supposed to be. However there is no voltage that I can detect in either REC or XMIT mode.

Thanks,

Robb KE8CEL

Mike,

The following were checked with the SG switch in the ON position.

I checked both 6146's pin 3 in REC and XMIT. Both read 285VDC in REC mode, and about 10 Volts less in XMIT.

I also checked pin 5 on both tubes. In REC both read -115VDC, and -65VDC in XMIT. That's using my Simpson meter that I just got, so I'm not entirely sure of its accuracy yet.

Repeating the check on pin 5, my DMM (Sperry DM-210A) indicated -101.9 Volts REC and -49 Volts Xmit. I couldn't use this meter on pin 3 because it won't go above 200 Volts.

And I probably checked the SG switch a few more times just to make sure I'm not making some dumb mistake.

One other question. Do the 6146's heat up like the driver tube? Mine don't. The driver heats up measurably, while the 6146's stay room temp.

It appears the final amp grid bias voltage is switching properly which results in what appears to be proper screen and anode voltage changes.

The KW hybrid 12BY7 driver tube operates in Class A. The Class A amplifier has an efficiency rating of approximately 50%.

The KW hybrid 6146 final tubes operate in Class AB1. The class AB1 amplifier has an efficiency of approximately 60%.

AG6K has a nice write up about different classes of amplifiers. Click on the following link for further details.

http://www.somis.org/D-amplifiers1.html

One of the books I recommend is John T. Fryes "Basic Radio Course", available on eBay in pdf format on a CD. The pdf format book is currently for sale on eBay ad #200692897318 for $8.99 plus $2.50 shipping. I highly recommend the book. The book may be old but the theory is just as valid today as it was back in the late 50s when the book was written. The book is written in easy to understand text with diagrams supporting the chapter's topics.

You might also check your local library, they may have a copy of John T. Fryes "Basic Radio Course" that you can check out. Amazon.com has used soft and hard cover copies for sale with prices starting at $3.99 for soft copies. You also might check local used book stores, that's where I found my hard back copy for $4.00.

Soft back copies of the book is also being sold at:

http://www.betterworldbooks.com/basic-radio-course-id-083060104X.aspx

for $9.09 plus shipping.

Vacuum tube and amplifier class theory is also covered rather extensively in the ARRL Handbooks which are available on eBay.

Two quick comments and then I will back away:

1. If you are bare hand touching the Final tubes glass envelopes to see if they are getting warm I sure hope you are aware that your hand is within accidental contact of 900vdc and perhaps death.

2. If your 6146 control grid operating bias voltage is -65vdc then your zero signal plate current would be close to 40ma when SG switch is On. You can prove that by measuring the dc voltage from Cathode to chassis ground (tube socket lugs 1, 4, 6). At 40ma should see approx -0.20 vdc. If you do have 0.20vdc and no indication on the panel meter with the meter selector switch in the Ip position I would try cleaning the switch. It can be accessed just above the IF board and behind the meter metal shield plate. I would remove the two screws that hold the metal shield and lay it back. Now can apply Deoxit D5 with artist brush or lite spray to the switch wafers and exercise the switch back and forth and let set a minute and blow out with canned air.

3. When you turn the Marker on does the S meter go up scale?

4. When you place meter switch to HV and flip to Send does meter indicate approx 900vdc?

Those test tell you that you havent lost the meter movement.

In addition to dirty contacts on the meter selector switch you could have dirty contacts on the RL-1 aux control relay and/or bad molex connector at Audio board. Sometimes tapping on the clear plastic case of the original Omron LZN4 will reveal the bad contact. Sometimes gently rocking the molex connectors will reveal the problem.

Thanks, Terry, for your post. I appreciate it and can certainly stand the warning. More out of luck than wisdom, I'd been using an infrared thermometer to check the tube temps. Having to remove a steel cover with the words "Danger High Voltage" was enough to convince me I didn't want to have any up-close and personal time with anything behind it.

I checked lugs 1, 4, and 6 of both 6146s. The SG switch was on. I checked in REC and SEND. At no time did I see any evidence of any voltage.

I'm not sure if you're referring to the Marker on the SM-220, or something else. In any case I'm afraid I don't understand how to do what you asked.

With the meter set to HV I get a reading of over 900 volts when in SEND.

Thanks again. If you have any other ideas or suggestions I'd appreciate hearing them.

OK I am glad you recognized the hazard and used a non-contact means to monitor temperature. Best safe work practice is to never go within reaching or falling distance of high voltage unless properly protected. Protection can be personal protective gear such as insulating gloves or some kind of insulating barrier. Very easy to make accidental contact. Same goes for remove and install of the PA cage cover plate. Dont remove and install it with the radio turned on. With radio plugged into 120vac recept and flipped to ON the HV power supply is energized in receive mode as well as transmit mode.

The "Marker" is your crystal calibrator that provides a tone every 25khz so you can align the analog dial. It is energized when you turn the Mic gain full CCW and feel and hear the click when the switch contacts make. You can see the white legend that says "Cal On". Read about it on Pg 10 Item 19 in your Operating manual.

I just wanted you to verify that your meter movement was not damaged during an arc over event. If your meter indicates in HV position then the meter is OK. No need to see if it deflects with the Marker turned on.

Were you trying to read approx 0.20vdc with a Simpson 260 vom? If so, not best meter for this test unless you configure it for the 250mv range which uses the 50ua meter movement to measure low dc mv. If you have a DMM may be better to use it if not familiar with how to read low dc millivolts levels with your Simpson.

Are all 7 of the Final Board hold down screws snugged down? Would be very unlikely to lose the chassis return path to the HV supply.

If you measure close to 5 ohms from cathode tube socket pin to ground, the screen grid voltage, control grid operating bias and the heaters are on as you have reported to W5RKL then you should have approx 40ma of cathode current. Unless you lost the internal cathode connections within the tubes. Another very unlikely failure. Do you have 12.6 vac heater voltage at the Final board? Can you see the filaments glowing in the 6146 final tubes? They are in series and if one is open both will not be lit. No heaters on means no Cathode current.

I wont respond anymore. Just thought I would suggest you measure the cathode voltage. My point was to see if you had a cathode current problem or a metering problem. I am still not sure.

The "marker" is referring to the Receiving calibration oscillaltor that you use to set the fine freq dial on the tuning knob. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Hello to the Group,

I realize test equipment has been discussed many times here but was wondering if anyone here had any suggestions for signal generators. Specifically if anyone has tried or used some of the newer cheaper models that you see online, like BK Precision for around $250.

I like the idea of buying older quality test gear but quite often it needs work and may end up costing more than a newer unit.

Also, if anybody has any solid vendors for new and or used, it would be greatly appreciated.

Brian,

This isn't exactly what you want to hear, but the D-104 w/G-stand is one of the best mics around for the hybrids from Kenwood. Also, the Kenwood MC-50. However, I am sure others will help you find an element for your Heil.

The hybrids need a high impedance microphone. My microphone is a low
impedance Beyerdynamics headset with a standard 200 Ohm microphone
element and a microphone transformer (like the Monacor MA100, available
from music stores) to match the impedances. Works like a charm.

From: Mike W5RKL
Topic: 54685 Message: 54691
Attachments: 2 described; binary payloads are missing from this source WARC

The TS-520 and TS-820 both have a high 50K ohm microphone impedance (see the individual hybrid's "User Manual" for details).

The TS-530 and TS-830 both have a low to high 500 to 50K ohm microphone impedance range (see the individual hybrid's "User Manual" for details).

A few examples of microphones that should work with the above KW hybrids. MC-50, MC-60, MC-80, D-104, and Shure 444. For best result, select the microphone that has the closest impedance match to your KW hybrid's microphone impedance input rating.

There are other microphones that may work with the TS-520, TS-820, TS-530, and TS-830 KW hybrids. Check the microphone specification sheets for details.

There are "Electret" type microphones being sold on eBay, hamfest, and other online website. Electret microphones/elements require a DC voltage, typically between +4VDC to +10VDC, for the Electret microphone element to work. The DC voltage is quite often provided by the radio. The KW hybrids do not provide a DC voltage to power Electret microphones.

The following picture is an example of an Electret microphone element.

Image result for electret microphone

The following picture is an example of a simple 2N3904 NPN transistor Electret microphone preamp circuit I came across while searching for information on Electret microphone elements. This is an example of a simple Electret microphone element circuit I've payed around with in the past. I have not tested a circuit such as this with any ham transmitter, including any KW hybrids. I have noticed the Electret element, when used with a circuit such as this, is rather sensitive and can easily pick up any noise in the room and voices from other people in other rooms plus TV audio in a room 30 feet away. Therefore, if you decide to build this circuit and use it with your KW hybrid, you're on your own.

Mike:

I built a couple of electret mike elements with transistor amps for use with aircraft radios, part of some modified military headsets. They worked quite well, were pretty reliable, and sounded great, but as you say, were very sensitive. The biggest problem was that it made the intercom unusable since it turned on the VOX activation of the intercom and you ended up listening to the aircraft engine noise over the headset.

Hi Kevin,

for the time being, as could not locate decent HP 8640B,
i did bought an Elecraft XG-3...
Works like a charm and basically, satisfy all my needs.
Have a cople hybrids and newer rigs which will need a
calibarated RF signal...
Now Friedrichshafen is coming up, who knows if "boat anchor Sig Gen."
could be find....
And yes, internal calibrator in hybrids, which puts S9 sig on
14.200 is remarkably close to signal level of XG-3 when,
in S9 calibration mode (-73dBm or 50 microV:)

Yes that's true Robert.

There are plenty of Electret microphone circuits people can experiment with. All one has to do is use their favorite search engine using a simple search phrase:

"Electret microphone circuits"

then spend a few bucks purchasing the necessary components.

Resistors, capacitors (electrolytic, ceramic disc and other types), diodes, even Electret microphone elements are cheap. There's currently a Chinese (Hong Kong) eBay seller who is selling 8 Electret microphone elements for "$3.64", free shipping. That's "45 cents" per element.

Power sources can be from inexpensive batteries. A 12VDC 200ma power source can be made using two 6 volt lantern batteries connected in series!!! Walmart sells a pack of two 6 volt lantern batteries for less than $5. Need more current, connect the batteries in parallel, doubles the current.

Experimenting with those simple circuits would require one to purchase a breadboard, self powered or powered from batteries. I purchased my self powered breadboard from:

allelectronics.com

I also purchased a bag of breadboard jumper wires which makes connecting components together very easy. No wasting wires by cutting at different lengths, stripping the insulation off the ends of wires, no soldering, simply plug the ends into the board to make the connection.

Members, you would be surprised at what you can learn by "doing", building simple circuits using inexpensive components. As the Home Depot saying going, "More saving, More doing", that same phrase also applies to ham radio DIY experimenting.

Kevin:

I have an HP-606A LF to VHF signal generator I inherited from a friend. I have had to rebuild part of the power supply section when an electrolytic cap shorted, and since it was for the negative high voltage section, and blew out some diodes and a meter when it went, it was a not that simple a job. But it's working fine now. Biggest problem is that it is a huge and heavy piece of equipment that takes up a lot of room.

I also have an HP-8654A signal generator which covers 10 MHZ to 520 MHZ. I paid $10 for it on ebay from a surplus place near my brother's home, and so there was no shipping cost. I had low expectations for it, but it only needed some knobs and works fine. The only problem is that one of the missing knobs has markings that enable you to determine the output level range, and so you have to do a little guessing there.

I just repaired an HP-3200B test oscillator that I had purchased before I got the 8654A, which has a similar range. Turned out that someone had taken it apart, got a stand-off in the power supply section in the wrong spot and that was shorting out the filament voltage. Now it works great - and I don't really need it because I have the 8654A. I guess maybe I should see I'll see about selling it.

I also have a Heathkit SG-6 signal generator, dating from the early 1950's I paid $1.50 for it at a hamfest and had to fix it too, but it is working pretty well, or at least about as well as could be expected. An HP it ain't!

The best thing in the way of signal generators I have seen recently is a seller on ebay offering Wavetek 3001 0-520 MHZ signal generators that were referbed in the early 1980's and then put into storage. It appears they are about as close to new as you could expect. I am really tempted to buy one because it would replace both the HP-606A and HP-8654A and give me a lot more bench space.

Finally, you will need a good digital frequency counter, too. For example, both the 3200B and 8654A have rather "notional" slide rule tuning that prevents you from getting closer than maybe 200 KHZ, at best, to the desired frequency. I have a Tektronix 2236 scope with built in freq counter that has been essential for both repairing various pieces of equipment and using the 3200B and 8654A. The 2236 helped me solve a a problem with a bad SSB filter in my TS-820S

So, there are many choices out there. Good luck!

Robert

Group,

Have a very nice condition TS-530SP that I picked up from a club member. Hears great.

On Transmit I am only getting about 15 watts output on CW and other modes. When in ALC to Setup transmit I am not getting any meter movement when attempt to TUNE. I have RF indication, IP indication and HV Indication.

Could it be the 6146 tubes are soft? I have read a lot about the potential of bad resistors. Any tips appreciated.

Thanks,

Kevin

Kevin,
You stated that you have: Ip & HV indication, but you did not state any values. At max output (100 or so watts) Ip should be around 225mA and HV 780 - 800 VDC...these reading are slightly variable. The NO ALC IN TUNE is a common problem, and is usually caused by resistors R15 and R16 (56K) on the Rectifier Board going high in value. You should also check the value of the 4 x 20ohm resistors(R-2,3,4,5) on the Final Amplifier Board, if these are high in value, you will get an erroneous Ip reading(high)These are wired in parallel...and should read very close to 5ohms(+/- tolerance) to ground and check the 2 x 100ohm resistors(R- 7, 8) on the same board. Reduced RF output is normal if you are measuring it when in tune mode.Check for falling drive just after key down...if it falls off...usually indicates failing driver. Check plate dip. Is it broad and shallow or narrow and deep? If its broad and shallow..usually indicates failing finals. Watch for falling Ip after key down...if Ip falls off..usually indicates failing finals. You may also have other problems...but check out the above first. You can also go the the group home page...and search prior conversations regarding ALL your above problems.

You only get ALC meter deflection when there is a lot of drive and it is starting to level the drive power out and keep from exceeding the point where you get flat top distortion of SSB audio. There is some output power even when the ALC does not show on the meter. When you tune in the CW or Tune position of the mode switch you can see a peak of the drive control on the Ip or RF output meter position. Maybe there is a weak driver tube or insufficient Screen or other B+ voltage. Setting of the "carrier" pot is critical and usually has to be turned up at least halfway to see the ALC metering come up. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

I too am having low output problems with very low ALC!

Here are the measured conditions:

1. PA tubes and driver are new (and, for insurance, tested).

2. PA Screen grid - 275 vdc RX, 125 vdc in TUNE position TX

3. Control grids: -110 vdc RX, -65 vdc TX: High pp drive voltage <100 volts

4. Bias set to 60 ma.

5. Alignment appears to be within average conditions.

6. New K4EEA relays installed on IF PWB.

7. Cathode resistors measure app. 7 ohms.

8. 100 ohm resistors within tolerance.

9. Output frequencies are correct on all bands.

10. Output in CW position is app, 50 watts at 14.175, less on 15 and 10 meters.

11. Other meter functions normal, RF gain functions (meter responds normally)

12. RX sensitivity low. 50uv does not provide meter indication.

Suggestions?

Dave, W5WP

Kevin,

So far you have been given some good advice.
You didnt mention (or I didnt read) if you had no ALC in tune or CW. As per Joe's email power down radio, discharge HV and check those resistors on rectifier board
You didnt mention if you had tried to rotate the carrier control?
Is the 15w output in full CW or SSB mode and is it on all bands? If it is the driver tube, I would tune up on 28.5MHz in CW and then tranmit. If power output and assuimng you ALC reading at this point, if the meter movement drops a good sign the driver tube is going soft
Even though you may have replace the RL1 relay on the AF board, I would have radio on in service position, and using an insultated tool tap the RL1 relay when in transmit.
Have you cleaned the wafer switches on the RF board?
Have you carefully checked the molex connectors?

If all these above potential issues are OK then I would proceed to the PA.

Again radio off, HV discharged, remove PA cover, and inspect the following area

Look at the following areas

Then go to the tall white wire wound former, check this to see if there is any discolouration/burn marks.
At the bottom of the same former check the type one RF cap and see if that is cracked or burnt, also check the small green choke, these typically get damaged due to incorrect tuning. You can refer to Ken's K4EAA webpage for photos.

If no joy with above possibilities, further investigation on TIF and other voltages may be required. A good well equiped test bench wi8ll make te job so much easier

Jan;

Thank you for the response.

I have researched the lists that I am aware of and have not found any detailed theory of ALC operation for the 530SP. It appears that what is affecting the transmitter and the receiver are interrelated.

The voltages (-6,3.2 and 9) that affect the AGC/ALC bus are correct as measured on the AV PWB. Voltages on Q1 (as measured with a high impedance digital voltmeter) appear to be correct as is the gain, measured with a Tek 465B scope.

There is less than 2 ohms resistance between the SO239 and TP1 which should eliminate the antenna relay as a source of trouble, at least on the receive side.

Hate to give up on this one as the person it belongs to is in no position to purchase another rig; another oil patch victim. A local tech passed on it - solid state rigs only - no hybrids!

Paxton:

It sounds like you are making great progress. If I may offer two suggestions:

1. You mention that the HV caps are leaking, and so you are planning to pull the finals pending replacement of the HV caps. But keep in mind that the HV caps are energized at all times when power is on, and if they are already leaking they could expire violently at any time. Perhaps you should consider replacing the HV caps before going further.

2. You mention that you want to get the NOS 6146 tubes "matched". I don't believe matching is necessary, as these tubes are connected in parallel. Matching is advisable when an amplifier circuit is push-pull. Also, your replacement tubes are "6146B" type; correct?

My experience is with a ts530 rather than the TS820/520 series, so I might be out of line (or outright wrong) with these suggestions. If so, I hope others will chime in.

> some matched.

Don't bother. They don't need to be "matched" to be used in this sort of application; and it's a waste of time, effort, and (if you buy them as matched pairs) money.

Besides, a tube tester won't tell you much about beam power tetrodes, other than the basics (shorted elements, bad filaments, and so forth). You have to test them on a "high-pot" ("high-potential") test set, which will apply a lot of voltage in the right places to see if they arc over, or break down under real-use conditions.

Testing on a "tube tester" won't hurt anything, and it will weed out any tubes that are shorted or the like. But passing a tube tester test won't guarantee that the tubes will not fail in power-amplifier use and conditions.

Jan:

ALC indication is not required for RF output power. You need RF voltage level at the Final tube control grids on the positive half of the RF drive signal to exceed the dc offset level that the operating bias establishes. Remember the RF drive is not swinging around "0". It is swinging around -55vdc to -65vdc depending on where the zero signal plate current has been set to with the bias voltage adjust pot.

So for most of the Hybrids that means you will need around 45rms to 47rms rf volts drive at the 6146/S2001 control grids to see any ALC deflection. If you have for example 35 rms rf volts drive there will be no ALC but there will be RF output.

When the control grids go positive with respect to the cathode there will be micro ampere grid current (around 35 to 45 ua). That grid current is seen by the ALC amp transistor that is essentially configured as a dynamic zener diode. It will produce a negative voltage (around -1.0 vdc) that bucks the +3.2 to +3.6 vdc ALC buss/rail voltage which in turn reduces TIF amp gain and drives the ALC meter up scale. Remember the ALC meter is a FET based reverse reading voltmeter. When ALC buss is at the RF-1 level the meter is caled for zero indication. When buss voltage goes lower than RF-1 level FET sees it and drives meter upscale.

First thing I would do is replace the 7 ohm cathode resistors. They fail conservatively as they make the Ip indication greater than what it really is (higher IR drop). You think you are loading heavier than you actually are. After replacing them adjust the zero signal plate current to 60ma.

Then I would measure the RF drive at the 6146 control grids with RF probe/VTVM (3 diode probe) or with RF Millivolt Meter or with O-scope.

Very easy to run the TX Level Diagram and in a matter of minutes find out where RF drive is low or missing and then concentrate troubleshooting efforts there. So few use this tool that KW gave us.

I have described more times than I can count what is required for ALC indication. Suspect if search on the Conversations it will produce many of those discussions.

Simple Driver stage test by turning off the SG switch has been described many times and can be found on my website as well.

Jan and others,

Not necessarily. A zero ALC indication in TUNE mode does not always mean there is loss of RF power output. ALC itself is not a required voltage in order to produce RF output from the final tubes.

Transmitter ALC (Automatic Level Control) is a "negative" gain control DC voltage that is produced in the ALC circuit when a "current" flows in the final amplifier grids. This can only occur when the drive signal level is at a level that, when applied to the final amplifier grids, results in the final amp grids to become positive.

The final amplifier in the KW hybrids, as well as many other vacuum tube transmitter amplifiers, operates in Class AB1. A typical Class AB1 amplifier does not have any grid current flowing throughout the drive signal's sine wave cycle.

Transmitter ALC gain negative control DC voltage is used for 2 purposes:

1. During transmitter tuning to indicate maximum RF drive to the final tubes grids (maximum ALC or Grid meter indication)

2. To help maintain final amplifier Class AB1 linearity during normal operation

As long as the driving signal from the driver stage does not result in the final amp grids to become positive, there will be zero ALC gain control voltage produced. It is possible for a KW hybrid final amp to produce power output yet there is zero ALC (no grid current) gain control voltage produced. This indicates there is RF being applied from the driver stage to the final amp grids but the driver stage signal is not pushing the grids positive, hence no ALC is produced BUT there is RF output from the final amp.

Thanks for the information on the tubes. You are correct in that the radio requires the 6146B tubes. I got a "lot" of tubes for a good price, with a few 6146's, four 6146B's, and a 6146W (from what ive read its for mobile/heavy vibration/military use)

Ive allready ordered replacement HV caps. I have read somewhere else that they have a tendency to go out with a bang. Ive had little 10uf 16v caps detonate on my bench before, I dont want to find out what these puppies would do.

At this point I am waiting on parts before I can proceed further. Some of the dead bands come to life when wiggling the band selector switch, probably stemming from the cracked plastic coupling. Removing the coil pack to facilitate maintenance was a pain last time, Id like to wait until I have everything together.

Thanks for the advice!

I would say the HP 8460B is likely the best RF signal generator a ham could find... it has a built in counter, produces virtually no phase noise, but is large and heavy... these are available at reasonable prices if one looks hard enough... With that I would recommend a frequency counter, again you can save money if you are using it for RF and radio purposes only, or if you know the maximum frequencies you might want to investigate... I have both a HP 5315B and a 5334B... these are excellent units, and mine both have the oven options, which makes them even more accurate and stable.

A scope would of course be first on the list, or rather, just after the DVM... one really does not need a scope with more than 100MHz capability, but I like a bit of head room and have a 300 MHz scope, Tektronix is the last word in scopes, in my opinion, and again, these can be had affordably if one looks around... I have analog scopes, not digital, but these work well for my purposes.

As DVM go, I like Flukes... just be careful to get one that can handle high voltages if you are working on boat anchor tube radios or hybrids...and quality high voltage capable test leads are important.I also have some analog meters, like an old Simpson and a more modern Amprobe, and a VTVM as well, in my case a Knight that needed some restoration.

On my list, but seemingly not as urgent: a deviation meter, most likely a Boonton from recommendations I received here and elsewhere, and a Spectrum Analyzer although again, not urgent. There are Rigol units now available for $1500 or so that get well reviewed, are reasonably adept, and small and light weight...

I presume you have an antenna analyzer, which is also of key interest to amateur radio enthusiasts... mine is a RigExpert, although I am hearing good things about a newer one, digital and reasonably priced, from China, that was well reviewed by ARRL a while back... cant think of the brand just now...

With this, and a good soldering/desoldering station, you should be set for repairing almost any radio, especially the hybrids and tube radios...

my 3 cents.

Date: 2016-05-15 19:23:36 UTC
From: Mark Gilger
Topic: 54718 Message: 54718

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Saturday net was run by Mark, WB0IQK. There
were 20 stations checking in under poor
conditions. There were 7 new station checking
in: NR8S, N1JEO, WA1ZVH, KD2EDV, N0NOW, W20JO, WB2QJ.

We had the following number of radios checking in.

1 running TS-520(x)
3 running TS-530(x)
4 running TS-820(x)
4 running TS-830S
0 running TS-510
0 running TS-511
0 running TS-515
0 running 599 twins
0 running TS-900

I was running my TS-830s and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
9 stations checking in under very poor band
conditions. There were 1 new stations checking in: KF5WXY.

We had the following number of radios checking in.

2 running TS-520(x)
2 running TS-530(x)
1 running TS-820(x)
2 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and
TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday net total = 66, Sunday total = 46
December 2015, Saturday net total = 55, Sunday total = 73
January 2016, Saturday net total = 129, Sunday total = 81
February 2016, Saturday net total = 98, Sunday total = 72
March 2016, Saturday net total = 74, Sunday total = 35
April 2016, Saturday net total = 101, Sunday total = 57
May 2016, Saturday net total = 37, Sunday total = 21 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Topic: 54719 Message: 54719

Hello group.
I Just picked up another 520s at a Hamfest. I was told it only needed tubes, which i had. I took it home and fired it up. No receive, then I notice there was no VFO plug. I put one in from my old 520s and re-powered up. Well, I tried to power up. nothing comes on, except the fan. There is no smoke, no funny sounds etc. its like a fuse blew. (both fuses on back panel are good) There is power coming off the transformer. Before I start going down the wrong path, i was hoping that this was seen before and i could be directed down the right path.

Thanks

Steve N7LWF

Hi Steve,

Troubleshooting 101 - you've already done the
smoke & sniff test, next is a really good visual
inspection to make sure there are no broken
wires, components or even PCBs and make sure all
plugs are seated correctly. Next is power
supplies. Start with the troubleshooting guide in
the back of the manual paying attention to the
power supplies for each section. Use the tune-up
guide and look at "Setting the 9V power supply .
. . " and see where that takes you.

Discount nothing and take the sellers advice with
a grain of salt. I think many of us have at one
stage or another bought a radio from a hamfest
that was "working fine" the last time it was
used. For what it's worth I think a completely
dead radio is better to troubleshoot than one
with a number of intermittent faults.

Good luck

Lou

Thanks lou, Since my last post, I decided to trace back the bundle of red wires up the front that power the pilot lights. They connect to a white wire that leads down to the heater switch. its has been melted. It will need to be replaced. unknown wire it smoked, maybe pinched to ground somewhere (?) also the generator board was missing a few screws and several of the wires were re-soldered very poorly. theses I have re-soldered. There was a black wire between the two high Voltage caps that leads to a ground on small circuit board (forget which one right now) it was also melted and the red wire to the cap was also meted, like the were melted together at one time. The radio looks super clean on the inside.... like it wasn't used much then it went to hell one day.

Jack,
Is this malfunction band specific...ie.. it only does it on 20M? It may be simple as dirty/loose contacts on one or more switch wafers or a cracked bandswitch coupler. Is there ANY play on the bandswitch when rocked left and right? NO play is good. If any play noted...then more than likely the bandswitch coupler has cracked. You can do a quick check by removing top cover and observing the (usually white) bandswitch coulper at the end of the shaft while rocking the bandswitch knob/shaft back and forth, OR with rig UNPLUGGED, top and bottom covers removed AND a check for any high voltage, remove the cover to the final amp cage, and check for HV at the top of the plate choke to ground, remove the front 6146, and with a BRIGHT light look at the coupler where there are 4 set screws(you will have to rotate the bandswitch to view them all. Look for slop and cracks. If cracked, new items available from: k4eaa"dot"com or hybridrestore"dot"com

I don't believe it is band specific, but the radio is usually on 20 or 40 meters when I turn it off. There is very little play in the bandswitch control. I have put DeoxIT on the contacts on the bandswitch contacts in the last month because when I first received the radio the 18 mhz. Band was coming in very weak. I wiggled the bandswitch knob very slightly and then the receive peaked. It still does this ocassionally on the upper bands. I will look at the bandswitch coupler , but again, it feels very tight. Thanks for your help Joe!

Jack,

Every new member who's application for membership to the Yahoo Kenwood TS-520_820_530_830 group has been approved, is sent 2 messages. One message is a welcome to the group message and the other message contains the group policies.

If you no longer have the 2 messages sent to you when your application for membership to this group then you should download them from the Yahoo Kenwood TS-520_TS-820_TS-530_TS-830 group server (requires you to log onto Yahoo Group TS-520_TS-820_TS-530_TS-830 group) or you can simply download both messages from my website. Click on the following link. When the page comes up scroll down to the bottom of the page and click on the 2 links provided. The pdf files will automatically download to your computer and launch the Adobe Reader.

http://w5rkl.com/manuals/

54728. Broke my shiny new VFO-230?

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-18 02:36:42 UTC
From: Jeff AC0C
Topic: 54728 Message: 54728

I picked up a VFO-230 + TS-830s combo from a buddy today. It was working FB at his house.

Brought it home and plugged the VFO into my regular TS-830s rig (not the new-to-me one), and it was showing frequency readings about 600 Khz high. Plus the rig was not responding to the VFO frequency changes. I wiggled the connector on the back of the TS830s and now the rig seems not to see the VFO at all.

Worse, when I plug the VFO into the new 830s, it’s not seeing the VFO either. So I have apparently done something – or my old TS-830s may have damaged it somehow.

Before I dig out the schematics and try to figure out what’s going on, I wanted to ask the board members if someone had encontered this before.

As it sits now, the VFO seems to respond properly (LEDs move with button pushes, memories are saved, etc, and the VFD frequency changes with the knob turn) – but the rig does not see the VFO. The two power on and off together so there is some amount of communication remaining!

Jeff...I have an interesting problem with my VFO-230 as well. I have the same symptoms as you described, when I power up both units at the same time. When I unplug the power on the VFO-230 and plug it back in while the 830 is still powered up all begins to work fine. Not sure why this is.but seems to be a workaround for me right now.

Let me know how it goes.

Jeff,

This sounds like the normal issue that lots of owners have. I have had similar problem. It relates to the vfo power supply.
Easiest fix is connect to 830 and leave vfo plugged into mains power switched on. Then turn on 24hrs later. This usually fixes the problem until you get around to changing electrolytics in the vfo power supply

Here is another possiblity:
The VFO socket on the TS830 has a small slide switch that enables the external VFO when the VFO/230/240/DFC230 cable is inserted. The switch is activated by the shell of the VFO cable. Eventually the tab on the switch breaks or wears off and the VFO fails to work - it powers up and has a display but will not change the TS830 frequency.
This can happen even if the VFO cable is plugged in and never moved/removed as it did for me on two occasions. I have swapped the VFO socket with the next one over (forget which one it is now) which also has the same switch and that worked for about 8 years until it too broke. I finally added a small toggle switch to the rear of the TS830 that takes the place of the one in the connector.

Looks like there is a combo of issues here.

I am guessing the old rig has the broken switch problem. It was responding to the VFO albeit with the odd frequency 600 khz off until I fiddled with the connector. Have to check that shell switch.

And for the main VFO, I hooked up it up to the new rig (the one that I bought with the VFO as a pair and was working at the guys house) – it did respond to the VFO but showed the odd frequency. Per the earlier suggestion, I powered off the VFO with the rig powered on, and when it came up, the rig and vfo were working properly as a pair.

Thanks for the suggestions to everyone. Looks like I'm more or less back in business.

This procedure is also documented in the VFO-230 operating manual. The VFO always has to be plugged into an alive AC outlet even if it's not being used. If you have a master AC switch that kills the AC to all your equipment, every time you turn it on you have to reset the VFO. You also lose any memories set during a previous activity. It was one of the dumber designs that Kenwood implemented.

This helped me thru that;
(Posted by another ham)

None of the Kenwood hybrid transceiver's (520, 530, 820, and 830) internal VFOs are powered directly from an internal connection to the VFO's power source.

The internal VFO in all of the hybrids (520, 530, 820, and 830) is powered from the transceiver's internal 9VDC source. The VFO's 9VDC power is routed through the rear remote VFO socket.

The remote VFO socket on the 520 and 820 models is a 9 pin socket while the remote VFO socket on the 530 and 830 models is an 8 pin DIN socket.

VFO power in the 520 and 820 models is wired to pin "9" and the internal VFO power connection is wired to pin "8". If the remote VFO is not plugged into the rear 9 pin socket then a jumper wire between pins 8 and 9 or the factory jumper plug (Gordon sells the jumper plug) is required. Without the jumper wire or plug, the relays will energize when the PTT is pressed or the SEND switch is place "UP", the dial lamps will illuminate, but the there will be no receive and no transmit because the internal VFO has no power.

The internal VFO in the 530 and 830 models is power through the remote VFO's 8 pin DIN socket's embedded "micro switch". The micro switch is "mechanical" and provides a path for the VFO's power source, 9VDC, to flow from pin 3 to pin 5, providing power to the internal VFO. No jumper wire or jumper plug is required. It's quite possible, over time, dust and dirt can collect around the micro shwitch plastic head that prevents the micro switch "mechanical" movement. Canned air can help remove the dust and dirt collected around the micro switch so the switch moves freely.

You can clearly see how the circuit is wired in the hybrid schematics.

Thanks for the comments!

In closing of this issue, I pulled the old rig to the workbench today and saw the switch was in fact not working properly. As a work around, I just cut the single orange wire on the switch which disabled the internal VFO. Plugged the VFO-230 in and like magic, it worked FB.

Make a few QSO on the CWT tonight and the VFO worked fine. It’s tune rate is pretty quick compared to my modern stuff on CW but that’s the nature of the beasties of that era.

Jeff,

Did you actually verify the Remote VFO DIN socket embedded switch itself is bad by first cleaning around the embedded switch actuator using cleaner then followed by generous amounts of canned or compressed air to remove any/all dust/dirt collected around the switch actuator to improve switch movement? I would have done that first before disconnecting/clipping any wires from the remote VFO DIN socket.

Over time dust/dirt can collector around the DIN socket's embedded switch actuator causing the movement of the switch actuator to stick in one position. If the embedded switch sticks in the "Open" position, as though a DIN plug is inserted into the DIN socket but there is no DIN plug inserted into the DIN socket, then the internal VFO will no longer have power, the PLL Unit will switch to an "Unlock" state, resulting in loss of both TX and RX.

You can see how the remote VFO DIN socket embedded switch S21 works by studying the transceiver's schematic.

54740. TS-520S - Zero Output

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-19 21:49:39 UTC
From: vortextube@...
Topic: 54740 Message: 54740

Hi Everyone,

I got this rig from a SK's daughter and was hoping to get it running.

It receives fine on all bands. However there is no output.

It looks very clean, no burns on coils or caps, filaments light up, relay clicks nicely when keying up.

Are there common causes for this? Where should I start performing tests on the rig? I would assume the final stage is completely blown or there is no input to it. Anyway, I look in there and have little other than a guess on how to check. I'd rather be a little more methodical. So any guidance is appreciated.

Also, I have seen mention of a schematics and expected voltages mentioned in the group. Anyone know where I can get the schematic for this rig?

Also anyone in the DC area on the list that could be recommended to fix?

Thanks,
Rob KB3RBA

http://www.w5rkl.com/

That's one.

http://www.hybridrestore.com/

is another. As to where to start, there are level diagrams and various troubleshooting guides on those pages, as well as lots of information in the archives of this list. The search function which the yahooligans provide is frankly a nightmare, but with some perseverance and a somewhat skewed approach to the key words you use for the search, you can usually get -something- relevant out of it.

Rob,
I don't see where you mentioned whether the IP meter, in USB or LSB transmit, indicates 60ma idling current or not. This is covered in the TS-520 user manual which you should have read before attempting to operate your TS-520.

If you do not have the service and user manuals, you can download them free from my website. Simply click on the following link. When the page comes up, scroll down to the Kenwood lists and click on the TS-520 model service and user manual links, one at a time. The manuals will download to your computer.

http://w5rkl.com/manuals/
You said there's no RF output and that the final amplifier is probably totally blown. How did you come up with that conclusion?
Do you have a 50 ohm dummy load? If not then I recommend you purchase one that has an RF power rating that's at least 3 times the maximum power output from a TS-520. The typical CW power output from a TS-520 is 100 watts. A MFJ-260 300 watt dummy load will work. All hams should have a 50 ohm dummy load to test and tune their transmitters into.

Rob,
First, check to see if the "SG" switch on the rear panel is in the "ON" position.
Operator/owners manual can be found at: w5rkl"dot"com (Mike is a group member) and n6wk"dot"com(Gordon-now SK group member)Both are free of charge.

Thanks for the advice.

The switch failure is on the actuator or however it’s captured by the shell. the capture lip seems to be slipping off the connector for some reason (which I know is a lousy explanation) – as I slip the shell into the socket, the switch engages and then with just a bit more wiggle, the switch seems to click and move back as if the VFO is not inserted. The switch internally probably works fine.

I have not looked into the mechanics of that switch as I only had about 10 minutes to see what’s up. And the rig is far too rough to be a candidate for the sort of careful repair you mention so I just cut the wire as it was the easy and fast solution – knowing that the rig would be otherwise non-functional absent the external VFO. Cutting the wire kicked the problem down the road and in this case, that’s a fine solution for now.

Subject: Re: [TS-520_820_530_830] Broke my shiny new VFO-230?

This helped me thru that;

(Posted by another ham)

None of the Kenwood hybrid transceiver's (520, 530, 820, and 830) internal VFOs are powered directly from an internal connection to the VFO's power source.

The internal VFO in all of the hybrids (520, 530, 820, and 830) is powered from the transceiver's internal 9VDC source. The VFO's 9VDC power is routed through the rear remote VFO socket.

The remote VFO socket on the 520 and 820 models is a 9 pin socket while the remote VFO socket on the 530 and 830 models is an 8 pin DIN socket.

VFO power in the 520 and 820 models is wired to pin "9" and the internal VFO power connection is wired to pin "8". If the remote VFO is not plugged into the rear 9 pin socket then a jumper wire between pins 8 and 9 or the factory jumper plug (Gordon sells the jumper plug) is required. Without the jumper wire or plug, the relays will energize when the PTT is pressed or the SEND switch is place "UP", the dial lamps will illuminate, but the there will be no receive and no transmit because the internal VFO has no power.

The internal VFO in the 530 and 830 models is power through the remote VFO's 8 pin DIN socket's embedded "micro switch". The micro switch is "mechanical" and provides a path for the VFO's power source, 9VDC, to flow from pin 3 to pin 5, providing power to the internal VFO. No jumper wire or jumper plug is required. It's quite possible, over time, dust and dirt can collect around the micro shwitch plastic head that prevents the micro switch "mechanical" movement. Canned air can help remove the dust and dirt collected around the micro switch so the switch moves freely.

You can clearly see how the circuit is wired in the hybrid schematics.

Three or four folks mention to check that it is on. Thus far nobody has mentioned checking to see that it actually bloody WORKS.

That switch, like all the other switches and pots has been known to get dirty and become inoperative.

Yes, check it. But you might also give it a small drop of contact cleaner and exercise it a few times, then blow it clean and dry with some compressed or 'canned' air. ("DeOxit D5" is the preferred brand of contact cleaner of most board members, though there are other brands which should be just as good. Your mileage may vary.....)

And the answer is...

The problem appears to have been that the heater filament in one of the 6146s burned out. The reason I had problems figuring that out was how I checked for it. Originally I used a meter across the the tabs for pin 2 and 7 that are soldered to the final unit circuit board. It was suggested to me that I should take the tubes out and check this and I was surprised to find the above result; one dead tube.

At some point it dawned on me that there are several connections to ground for the power provided to the heater filament. When I'd check the tubes plugged into their sockets, one read a little higher resistance than the other, but nothing significant. But I've now come to the realization that the resistance reading I was getting for the burned out tube was being backfed through the ground making it look like there was an intact filament.

So now I get an Ip reading on the meter! And I'll now embark on the task of going through the alignment process.

Thanks to all for your help and 73s!

Looking at the final unit schematic on the TS-520 service manual, V1 is the front 6146.

Using the TS-520 service manual schematic, look at pin "2" of V1 it is connected directly to the Final Unit's "H" terminal. Follow the wire from the Final Unit's "H" terminal you will see it connects to the RF Unit's "H" terminal to provide filament voltage to the 12BY7 driver tube. The same wire from the Final Unit's "H" also goes to one terminal of the "HEATER" switch. The HEATER switch is found to the right of the Rectifier Unit on the main TS-520 schematic. The other terminal of the HEATER switch the wire goes to the 4 lamps plus it goes to the 12 pin rear panel male connector, pin 7. Looking at the 12 pin "female" connector you will notice pin 7 has a "jumper" inside that connects pin "7" to pin "10". Pin 10 on the rear panel "male" connector goes to the "12.4" terminal on the power transformer. This is the filament wiring for the driver and both final tubes. If one 6146 filament burns out then both 6146 filaments will NOT be lit.

The 6146 filaments are wired in series which is why you find 12VAC, not 6VAC, on pin 2 of V1. You will find 6VAC on pin 7 of V1 and pin 2 of V2 but pin 7 of V2 will be 0VAC since it is ground return for the 12VAC filament voltage.

Rob,

What makes you think your TS-520S requires an alignment? What thorough troubleshooting steps did you take that clearly indicates your TS-520S requires aligning?

The only alignment steps I would suggest you perform is on page 45 in the TS-520S service manual. Test equipment required for this simple check/adjustment is a DC volt meter.

"2. Setting the 9VDC Power Supply and FET Bias Voltage"

Rob,

What makes you think your TS-520S requires an alignment? What troubleshooting steps have you performed that clearly indicates you need to align your TS-520S? Just because your TS-520S is old and has had numerous previous owners does not mean you should perform the complete alignment steps. The only alignment I would suggest is on page 45 in the TS-520S service manual titled:

"2. Setting the 9VDC Power Supply and FET Bias Supply Voltage"

Other than that I would not recommend you perform any of the additional alignment steps.

Hello Rob,
The first thing you might want to check is the SG switch on the back. Make sure it's in the ON position. 73

On Thursday, May 19, 2016 5:09 PM, "vortextube@... [TS-520_820_530_830]" <TS-520_820_530_830@yahoogroups.com> wrote:

  Hi Everyone,
I got this rig from a SK's daughter and was hoping to get it running.
It receives fine on all bands. However there is no output.
It looks very clean, no burns on coils or caps, filaments light up, relay clicks nicely when keying up.

Are there common causes for this? Where should I start performing tests on the rig? I would assume the final stage is completely blown or there is no input to it. Anyway, I look in there and have little other than a guess on how to check. I'd rather be a little more methodical. So any guidance is appreciated.
Also, I have seen mention of a schematics and expected voltages mentioned in the group.
 Anyone know where I can get the schematic for this rig?
Also anyone in the DC area on the list that could be recommended to fix?
Thanks,Rob KB3RBA

Rob: Performing a complete Service Manual alignment is not a substitute for troubleshooting to determine and correct an operational issue. If that is why you want to run the steps I suggest you not do that. Also, alignment is not something that you should do on any regular basis (not like giving a car a 10,000 mile tune-up as we had to do in the old points and plugs days).

Alignment comes with some potential risks. Including wearing out adjustment points and/or breaking an adjustment device such as a ferrite core in an inductor or mis-adjusting stagger tuned circuits like the BPFs.

The Service Manual is really meant for trained/qualified service technicians and is written at a level that assumes a certain base knowledge and experience level both theory/fundamentals and KW hybrid specific and having the required test equipment and knowing how to use it. For these reasons the steps often do not appear to have a lot of "meat on the bones". Lastly, there are errors and omissions in the steps and some of the errors can be gross including calling out wrong test point, wrong adjustment device, and wrong acceptance criteria. Takes some experience to recognize this.

I perform a full service manual alignment on every radio that crosses my bench (literally hundreds of hybrids) and I do that as I have no idea how many people have been under the hood and I want to re-baseline the radio for the customer. It is common to find items grossly mis-adjusted. With lots of experience you often can tell when radio isnt working to optimum, but many things require measurement.

If you troubleshoot your radio and fix the problems and want to re-baseline your radio I suggest that you perform the abbreviated alignment detailed in Section 6 Maintenance of your owners operating manual. KW provides this info for the owner operator using the Marker as a signal source and the S meter as a voltmeter/detector. The only step you wont be able to do as directed is setting the S meter span trim pot for S9 indication with 50uv input signal. In lieu of that you can just set the span pot for an S9 indication on 14.2mhz using the Marker signal and call it close enough for what an S meter is really any good for ie providing comparisons.

You may ask how did K9TW learn to perform the full Service Manual alignment if he didnt try it. A fair question. I have agood basic electronic and basic RF communications background. This was acquired by formal technical schooling, self study, and lots of hands on. I have been licensed for over 50 years and my focus has always been building, repairing, testing etc. I am in my 11th year of hybrid servicing. Yes I had to start somewhere, but my first time under the hood was not on a sophisticated hybrid transceiver. Back in my day most of us got our first taste of alignment with 5 tube AC/DC 455 IFs, Kit building, and Homebrewing. It takes some intuition to look at a hand wound coil and know turns need to be spread apart or squeezed together or wires twisted for form a gimic capacitor. When the novice asks how did you know how to do that, it is often a very hard question to answer. Just like asking a golfer how he put that back spin on the ball.

Today you have an advantage and that is this forum. I had no such source of help.

So, if after fixing your TS52S you want to run the abbreviated alignment detailed in your Operating manual here are some tips to consider:
1. Make sure you use a nylon or delrin 2mm (.078) hex alignment tool on the Coil Pack (hanging boards) ferrite cores. Never use metric metal hex keys. Ken K4EAA sells proper tool or you can buy a Philmore 63-9300 tool off ebay or amazon.
2. Visually examine all the cores with brite light for cracks. If cracked you will have difficulty turning as they expand when tool is inserted. Almost always have to drill them out which is not easy. If cracked better off leaving alone unless a performance issue such as Het Osc not reliably starting requires the adjustment.
3. Before attempting to turn any core suggest you apply a drop of lubricant such as WD-40 or Tri-flow to act as penetrating oil to wick down between core threads and cardboard former. After application let it set to give time to work.
4. Visually inspect all formers to make sure not twisted off their mounts. If they are carefully re-position and re-affix with super glue or an adhesive like "goop". Let the glue set until cured. If twisted off the mount a pretty good clue that the core is frozen in place.
5. If the VFO does not track well DO NOT attempt to adjust the VFO variable inductor L1 without examining to see if the brass lead screw is retained with a coating of tan/beige thread locker. Also look at the adjustment slot on top of the screw to see if one of the ears are broken off. If either condition exist you are done. Only way to turn the screw is to remove the VFO, remove the shield can, and apply high heat to the lead screw. If an ear is broken off need to saw off the other ear and screw on a small brass metric hex nut and solder in place. There is one more thing you can do to improve VFO tracking and that would be to just adjust using only TC-1 air variable trimmer cap. Set the VFO to around 250 and turn on the Marker and peak the S meter and then and adjust TC-1 for spot on zero beat at 250. This isnt a very good method as the VFO will not accurately track as you move up or down frequency from 250. It will gradually get off frequency as you move away from 250.
6. DO NOT attempt to align the Rx or TX Band Pass Filters unless you have a Sweep Gen with marker capability, a Spectrum Analyzer w/Tracking Gen, or a VNA. I find many BPFs have been messed with and is common cause of low or no ALC indication on the higher bands.

There are other issues such as LO levels too low for proper mixer operation (VFO set to 600mv vs 900mv). Adjustment requires RF millivolt meter, O-scope, or RF probe/VTVM to measure and adjust.

This isnt all inclusive but gives you some things to think about and look for if you want to proceed with alignment after repair.

Summary:

Performing the full Service Manual Alignment is not a substitute for troubleshooting. Suggest after finding and fixing operational issues if you want to "align" your TS520S that you perform the abbreviated alignment in your Operating manual observing the caveats I have listed above. To troubleshoot among other things you need to understand the basic building blocks of a SSB transceiver. Can start by studying the TS520S Block Diagrams and reading the Circuit Descriptions and of course coming here and asking for help. Realizing like all internet information you will need to sort out the "best practice" from the "good" from the "good enough" to the "flat wrong". If info provided (sometimes by a well intentioned person) is really off base usually someone will speak up.

If you want to see some Very Bad advice from someone who is probably a very nice young man go to You Tube and enjoy. I am going to order my Deoxit Dip Tank and will never clean a PA

The following link is another Youtube video that shows improper used of DeoXit D5 contact cleaner!!

https://www.youtube.com/watch?v=mKTehK8JCFQ

Note the person never uses canned or compressed air after apply excessive amounts of cleaner to the wafer switches, to remove the cleaner residue.

Part 2 of the above video can be viewed by clicking on the link below:

https://www.youtube.com/watch?v=UMNyv49lwYI

The DeoXit D5 used in the video is "Flammable".

Not all DeoXit D5 contact cleaners are flammable. Refer to Craig Labs website for further details on DeoXit D5 and F5 cleaners.

http://store.caig.com/s.nl/sc.2/category.188/.f

If DeoXit D5 contact cleaner and F5 Fader control cleaner/lubricant is used properly there is no danger of damage to wafer switches, pots, and slide switches as well as variable capacitor baring and flex shaft to frame contacts. I do not spray large amounts of cleaner on a pot, wafer switch, of slide switch as shown in the above videos. I immediately follow all cleaning processes with generous amounts of canned air (I don't have an air compressor) to remove any/all cleaner and corrosion/dirt residue on the switch and surrounding components/area. I have been using DeoXit D5 and F5 cleaners for over 10 years and never experienced any problems/damages to wafer switches, components, or PC board that some people/hams claim they have experienced. I apply small amounts of D5 using a cotton swab or a soft child's tooth brush. For pots I "gently" press the value and when the spray begins, I release the value, applying only a very small amount of cleaner to the pot. I use the same canned air process once the pot has been cycled throughout its range 3 to 4 times.

Hi Everyone,

Thank you for all the input. I really appreciate the documentation, videos, links, and explanations that clearly took time to write.

I started with the schematics and troubleshooting decision trees. Several times referring group regarding fixing VLC issues, common final issues, I increased my visual inspection to include the cracked cores...

I have a handheld with wide band receive. While I was testing I detected a small chirp of RF while flipping the send switch.

At that time, I decided to clean all the switches, rotaries, reseat the tubes, and I cleaned the relay contacts. (The relays were Omron, i'm curious if those were OEM?) Not sure what did it but I powered up and it works. It was just dirty somewhere is all I can figure.

Thanks again to everyone.

Rob,

Rob,

Yes, the original relays in the KW TS-520/S/SE series transceivers are "Omron" 4PDT 12VDC. Unfortunately the Omron 4PDT 12VDC 300 and 385 ohm relays are no longer available. Original Omron relays can be found in KW hybrid parts radios or from Walter Dilley, walter.dilley@....

You will notice the coil resistance is slightly different on each relay. I could have the relay coil resistance backwards indicated below.

The Control relay RL1 located below the MARKER and VOX Unit boards, has a DC resistance of 300 ohms stamped on the coil.

The Final relay RL2 located below and towards the rear of the Final amplifier and is enclosed inside a small metal enclosure has a DC coil resistance of 385 ohms stamped on the relay coil.

There are replacement 12VDC 4PDT relays you can find on the web. These relays have the same internal relay terminal connections in both energized and non-energize states that the original Omron relay have but the coil resistance is 250 ohms verses the Omron 4PDT 300 and 385 ohms relays. I am not suggesting you should use these relays in place of the original Omron relays. I am only providing you with information you may run across if you are searching for a replacement relays, nothing more.

The replacement relays have the following data stamped on the coil. I have 2 of these relays and have tested them using a 12VDC battery source voltage (two 6 volt lantern batteries in series) connected across the coils. The relay armature is not sluggish but rather pulls rapidly onto the relay pole and the coil current levels vary between .047 and .049 amps with 12VDC source voltage. Each coil has the following data stamped on the relay coil (note there is no DC voltage indicated):

F&Bv.2ssb
01/103B
250 - 3800
0.09 CuL

"FUJISU" is stamped on the top of the clear plastic cover.

Hi Bob,

Tony here, VA7TF. I rejoined the group but this message is going direct
to you.

The 60 ma is the idle current of the 6146B's. Nothing to do with the 12BY7A.
Are you in the IP position of the switch?

Also, if the SG switch on the back is OFF, there will be no plate
current (60 ma idling).

Tony

Bob,
The 60ma idling current does not originate from the driver tube. The 60ma is the normal no signal Class AB1 amplifier "Idling" that flows in the 6146 final tubes, in transmit, when no RF is applied to the final tube grids.

I'm going to assume you have the meter switch set to "IP".
The following are a couple of reasons why the meter is not showing 60ma idling current in transmit:
1. Heater switch is not set to ON2. Rear panel SG switch is not set to ON3. Both 10 ohm 1 watt 6146 final amplifier cathode resistors are blown open4. One or both 6146 final tube filaments are burnt open5. Control relay located on the Relay Unit below the chassis has failed to energize

Items 1 and 2 are the easiest to check. The HEATER switch is located next to the main power switch on the front panel. The SG switch is located on the rear panel (see the TS-820 User manual for further details)
Items 3 and 4 require removing the 820's top and bottom covers. Remove the power cable from the rear of the 820 BEFORE attempting to remove both top and bottom covers!!!
Item 3 requires turning the 820 upside down and viewing the two 10 ohm 1 watt 6146 cathode resistors at the bottom final amplifier PC board.
Item 4 requires removing the cover from the final amplifier. Understand there is always, 100% of the time, +920VDC plate voltage inside the final amplifier when the 820 is powered ON!! NEVER put your finger(s) nor touch ANYTHING inside the final amplifier with the 820 turned ON!!!!

Item 5 can be checked by "listening" to the TS-820 for the relay "click" when switching to transmit. Turning the TS-820 upside down and watching the relay on the Relay Unit is also another way to check the control relay. There is another relay, the Antenna relay, that is located in a small metal enclosure next to and towards the rear rear of the final amplifier PC board.
If you do not have the TS-820 user manual, you can download it free from my website:
http://w5rkl.com/manuals/
Scroll down and click on the TS-820 user manual link and the TS-820 user manual will download to your computer in pdf format.
If you do not feel comfortable or you lack the skills and experienced necessary to "Safely" perform items 3, 4 and 5, I do not recommend you perform those steps but rather find a local ham who has the skills and experience to "Safely" perform those steps. The voltages inside the TS-820 can KILL YOU!!!!

Sorry to jump in but I have a question kinda along the same lines dealing with PA. My 820S is only putting out about 50 to 60 watts on most bands, sorry don't have specific per band at my fingertips. I do have 60ma idle no blown resistors that I can tell, did the driver tube leakage test and it holds and also the finals don't drop on key down just low output. I'm sure these are the original tubes since they are the 2001's.

If it turns out I do need new finals 2 questions, should I go with 6146B's or 6146W's? Also since I'm got her opened up should I replace the driver too or try the finals first? I hate doing shotgun replacements.

Also further notes when I bought this radio at the hamfest I never checked or tried neutralizing the PA tubes.

Mike (W5RKL) I'm sure you will jump in and advise with your depth of knowledge on these great rigs. I do have both owners and service manuals.

May request someone do a YouTube video on how to diagnose and test these rigs, guess you can say I'm a visual learner.

Thanks guys you are the best.

ps. Did the Kenwood not happen this weekend?

Rory

From Bob Holland, KG6DHQ, About 60 ma on TS-820

Real quick, I probably know enough about electronics to keep fingers out of bad places, but not enough to repair radios. I am going to be 66 next month and am retired from AT&T and the Army. I got 39 1/2 years with AT&T and 26 with the Army (2 years, active and the rest reserves) In the reserves I was an instructor and taught radio operator classes, mostly RTTY. I got interested in electronics because my father was a TV repair man for Muntz TV back in the 50's.
I got my tech license back in 2000. I finally passed the 5 wpm CW (when it was still required) and got my General, and did not use CW again. A small group of friends started a slow speed CW net that I joined. We have been going at it now for about six months. I am probably comfortable around 10 wpm now, and our net continues.
The TS-820S I purchased from a garage estate sale and did not check to see if it operated. I also have a TS-830S that was working till a couple of weeks ago. It has 60 ma but no power out, this one later. I appreciate all the help I can get and really want to learn more about the "inter secrets" of what make them work.

Bob Holland, KG6DHQ

We had a good turn out for the Dayton Kenwood Hybrid forum this year. We counted 67 people in attendance.

For all those that were able to attend, I want to thank you.

In preparation for next year I would like to request idea's for the 2017 Forum material. In addition, if anyone would be interested in presenting something of your own, I would appreciate it.

Thanks,
Mark, WB0IQK

Hi Martin,

I've been to Friedrichshafen hamfest twice, once in 2000 and again in 2001 while I was living in Leonberg and working for General Dynamics Network Systems supporting EUCOM on Patch Barracks near Vaihengen. Great hamfest, wish I could afford to go back one more time but being retired, the plane, hotel, and rental car expenses prevents my wife and I from doing that. Have fun at Friedrichshafen hamfest.

54767. 60 ma bias current on TS-820S

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-05-24 22:26:55 UTC
From: kg6dhq

From Bob Holland, KG6DHQ

My 820 that I purchased from a garage sale has problems. On the first step of setting it up, I am having problems with the 60 ma bias current.

The heater switch is on
The SG switch is on
The amplifier cathode resistors do not appear to be burnt or damaged
And the relay visible on the bottom operates when the send switch is operated.

But I do not know how to check the filaments on the final tubes.

I am on 40 meters, Mode switch on LSB, meter switch on IP and the meter will show a current, but every time I check there is a different value. I tried adjusting with the rear pot, but the 60 ma keeps changing, drifting up or down. I can set it at 60, go to tune/ALC, hit send, and the meter shows about 25. It will not move with the drive control, just stays on 25.

Robert,

Have you tried cleaning the bias pot and then blowing out with compressed air? The pots can become clogged with debris or are just plain dirty. Always start with basics then move forward. Don't forget to disconnect from mains power then allow for hv discharge.

It's very possible the bias pot is very dirty that needs cleaning.

Turn the 820 OFF, disconnect the 12 pin power connector from the rear, then allow 5 minutes or so for the filter capacitors to bleed down to zero.
Remove the top and bottom covers, turn the 820 upside down, and locate the bias pot. Give the bias pot a shot of contact cleaner then rotate the bias pot throughout it's range 3 to 4 times. Use canned air, available at Walmart's TV/Cell Phone department to remove any cleaner residue.
Read and adhere to the warnings on the D5 can's label.

put the covers back on, connect the 12 pin connector to the rear connector, connect the 820 to a 50 ohm dummy load, then power up the 820 and check the IP meter in USB or LSB mode for a stable 60ma.

Bob said the IP meter display unstable IP current. That meter indication would state there is current flowing in the 6146 final tubes. It's possible the tube socket may be corroded causing intermittent/poor connection to the tube pins.

Bob,

I don't recommend you jump to conclusions and replace the bias pot before you have taken steps to clean the pot and test for a stable IP idling current indication.

I recommend you clean the pot using either DeoXit D5 contact cleaner or DeoXit F5 fader cleaner and lubricant then rotate the pot numerous times followed by use of canned air to remove excess cleaner. Next, test the pot by performing the 60ma idling current adjustment found in the manual.

If the radio has sat for a long time in a dirty or corrosive environment you may have to perform the cleaning process more than once or twice. You also might consider applying a small amount of contact cleaner using a cotton swab to the tube sockets (power turned OFF and 12 pin power connector on the rear removed from the radio) then insert the tubes 3 or 4 times. Do not rock the tubes in their sockets, especially the 6146s. Rocking a 6146 in it's socket can break the plastic guide on the base of the 6146s. Make absolutely sure the HV Filter capacitors have bleed down to zero before removing the plate caps on the 6146s. Use a DC volt meter to check the voltage at the top of the RF choke in the final amplifier BEFORE touching the plate caps!!! Check the 6146 plate caps to ensure they are still secure and not loose. I've had 6146 that had loose plate caps and exhibited PLATE/IP meter instability.

As has been pointed out by others, the possibility is that there is dirt or corrosion in various places... If you dont own a can of DeOxIt now is the time to buy one... or three... I highly recommend cleaning ALL pots and tube sockets, rotary switches, and connectors of any sort... I would also recommend cleaning the relay contacts with a piece of paper sprayed with DeOxIt D5 and slid between the contacts of the relay while holding the relay closed... all of course with no power on... clean the power connector as well as tube sockets for all three tubes, clean the final connectors atop the tubes as well... and as I said, all pots, rotary switches, and other connectors... tube sockets can be cleaned best by spraying D5 on the pins of the tube and then inserting the tube in to the socket, removing it and doing so again a couple of times... pots as described by others... rotary switches by spraying contact points and rotating the switch its full range several times back and forth... Also clean any switches, get the D5 inside and rock the switches or slide them back and forth...

Blow everything out with compressed or canned air (I personally use a scuba tank as my air supply, but then I have many of those around...)

You will be amazed at what just doing a thorough cleaning accomplishes...

Paul

Bob,
Be careful with the term "insulated screwdriver." I have seen metal shaft screwdrivers that have been covered with heat-shrink tubing with just the very end exposed...and being called "insulated." This is BAD NEWS when it comes to messing around in the final cage area of ANY rig that has 900+VDC. Hope you are well insured...the XYL will need it when your SK. You can get many appropriate tools from various places, or make it yourself. A piece of 1/4" hardwood dowel with the end cut/tapered to fit the slot, an old plastic knitting needle, or a good piece of stiff and hard plastic will also work. At times the neutralization screw is very stiff and you will need to have something that is relatively stiff/stout.

Bob,

As I recall, the access to the neutralization variable cap for the 530/830 series is from below. Turn the rig over and look underneath the final cage. Of course you must use a non-conducting tool for the adjustment. The cover for the final cage must be in place for neutralization. See the manual or various on line resources for instructions(I follow the K4EAA website procedure).

Take a look at all the recent threads on no/low power, particularly with regard to the band switch. While you are in there, visually check for a cracked nylon coupler and give the band switch contacts a good clean with D5 applied to the contacts with an artist brush, followed by canned air.

Another frequent source of trouble is the multi-purpose relay under the radio.

Be sure to follow good safety practice while working around the high voltages present in these rigs, particularly discharge of the high voltage caps. If you are not sure, please ask or seek help from an experienced hand.

Good luck!

Dave K3DWB

Look at page #31 in the instruction manual:

http://wb4hfn.com/KENWOOD/Manuals/TS-830S%20Instruction%20Manual_W0NTA.pdf

or page 10 in the service manual.

http://wb4hfn.com/KENWOOD/Manuals/TS-830S%20Service%20Manual_W0NTA.pdf

It points to the location.

Bob,
What you should have done is checked all the typical small issues first. Af board relay,Molex connectors, solder joints the 4 x20 ohm resistors on the final board, sg switch etc. And then begin voltage and TIF measurements. Some of the measurements will need good instrumentation like scope and rf bolt meter. Welcome to the world of hybrid ownership, hihi.

Bob,
There is NO need to purchase "matched pairs" of final amplifier tubes for the Kenwood Hybrid series...waste of money. The reason(s) have been well discussed, and can be researched through prior conversations via the group home page.
The neutralization cap/adjustment on the TS-830S is located on the underside of the rig. A look at PG 43 of the TS-830S Service Manual will show you the location which is: with the top and bottom covers removed. and the rig with the bottom up, and the front facing you, look to the upper left hand side(the final amplifier board- X56-1380-00) you will see a "U" shaped section with a slotted type screw head...that's the neutralization adjustment---TC-1.
Intermittent, then no output could be several things. Malfunction of RL-1 on the AF unit...mostly affects the return to receive from transmit, or a malfunction of the T/R relay located under the metal enclosure on the underside of the rig at the rear, next to the final amp board..

Bob, if you have not already obtained an Operating/Owners or a Service Manual, it is HIGHLY suggested that you obtain one. You can get either at: n6wk"dot"com(Gordon-group member-now SK) or w5rkl"dot"com(Mike-group member) all free of charge

You can use a normal flat blade screw driver. There are 2 methods:

1. Slide a piece of heat shrink tubing over the flat blade screw driver's metal shaft and heat the tubing, covering all but a small portion of the shaft's flat blade end.

2. Wrap the flat blade screw driver metal shaft with electric tape covering all but a small portion of the shaft's flat blade end.

Either method will allow you to use a normal flat blade screw driver to adjust the final amplifier neutralizing capacitor.

Bob:

An insulated (plastic) tool for adjusting the neutralizing capacitor is
available at http://www.k4eaa.com/parts.htm. The tool is the "AL-2".
This site also offers many other kenwood hybrid parts. I've been very
pleased with several orders.

Hello to the group, at the weekend I picked up a 80-10 metre version of the the TS -520, at present it receives only and not too well, not the bad condx problem the xtl calibrator signal is way down.
Not having a manual for this 520, I could with knowing a bit more about it. Does the JJY/WWV push button bring in a converter?
I'd like to try and see if the CW filter out a TS 510 would be ok here in the 520, they are at the same IF. Seems the optional filter in the 510 is well and truly fixed..70 trees ian g3yrq.

Hello and thanks for the add to the group.

I recently purchased a TS-530SP and love it! Reminds me of tube type rigs I've had in the past. Love having actual controls rather than just menus for settings! Hope to learn tips and tricks of the radio in case of problems down the line.

I am looking for a CW filter, YK-88C or YK-88CN, solder-in, for it if anyone happens to have one at a good price.

73,
Tom, WA0E

From the User's Manual, section 4.5:

The JJY/WWV switch tunes the receiver to the 10.000 MHz time standard frequency, so you can check the tuning accuracy.

With the receiver on, an antenna connected, RF gain up, AF gain set to a reasonable volume, turn the main tuning knob to the "0" (zero) mark. When you engage the JJY/WWV switch, you should hear the time standard tones and ticks, one per second.

To get a copy of the a manual, all you need is to find some reasonable internet connection and download any or all of the relevant documents (operator's manual, repair and service guides, schematics, alignment sequence, etc.)

Find below direct links to the user's manuals, service and alignment documentation for the TS-520.

If by any chance the radio is one of the other models than a straight TS-520 (for instance a TS-520S, or TS-520SE) then the last link is to the main downloads page. There you will find links to the other models, as well as links to the schematic diagrams. There are other sites with this information; contact us again if for some odd reason you have problems getting to this particular site.

Hi,
I have just bought from an SK sale a TS530sp . This is my first foray into Tube radios (Except for home brew gear).
Receive is OK but I have problems Tuning up.
1/ Set mode sw to Tune . Set meter to ALC adjust Drive . OK.
2/I can't dip the Plate in the Tune mode. Meter on IP setting.
The only way I have found to get output is to turn on the VOX set the Mode switch to CW and use a Morse key. The send key only seems to works on Tune setting.
My Mode switch is wobbly (Broken?) and I have used spray cleaner on the switch .
If I want to inspect the Mode switch how does the knob come off?

Any help would be most appreciated.

Richard,

If your mode switch is broken, first step is replace this switch, you can contact Walter.dilley@..., he has a huge range of parts.
I suggest you download the operator and service manuals. Then report back. I haven't seen a broken mode switch before, but without that working properly you are chasing your tail and could create a problem rather than fix

Richard,
To remove knob simply pull back away from radio. Yo remove switch completely, remove all knobs, top and bottom cases then the 4 screws that hold the front panel on. Then undo hex nut and the mode switch will be able to push backwards.
Your hex nut could have come loose and moves around, this could mean a broken or shorted wire

Hi Butch and Dave,
thanks for your replies ,much appreciated. I have actually managed a QSO so there is not much wrong with the rig. Who knows the previous owner may have been living with the problem!

Butch The Load knob is all the way CCW. but thanks for the tip.
Dave. Thanks for the info regarding the removal of the front facia. That is my next step look at the switch assembly. I bought the rig basically for QRP but now I am wondering if you can turn the power down that low as my one qso today was 100 watts with the drive completely CCW.
I have a lot to learn!

Many thanks again,
Best 73’s

Hi,
I have just bought from an SK sale a TS530sp . This is my first foray into Tube radios (Except for home brew gear).
Receive is OK but I have problems Tuning up.
1/ Set mode sw to Tune . Set meter to ALC adjust Drive . OK.
2/I can't dip the Plate in the Tune mode. Meter on IP setting.
The only way I have found to get output is to turn on the VOX set the Mode switch to CW and use a Morse key. The send key only seems to works on Tune setting.
My Mode switch is wobbly (Broken?) and I have used spray cleaner on the switch .
If I want to inspect the Mode switch how does the knob come off?

Any help would be most appreciated.

Richard,

That is not the correct position for your load control.
Is it the same across all bands or just band specific?

If you have a dummy load, try tuning into that. On my two personal 530s my load control is between 10 & 11 o'clock. On all the. 30 series radios I have worked on none have had load control either fully meshed or fully open.
This would mean you don't have enough capacitance or too much. The pi network is not correct.

An example to ponder over.
I had an 830 on my bench the other day that kept tripping the rcd of the house, with radio fuse blowing.
The load control was welded shut from an arc over with the fan wires resting against the bottom of the 6146b. the tube melted/burnt the glass insulation on the 100v fan wires and then shorted out house. The arc over had occurred at the owners house sometime before.
Messy job to remove and replace load control.
As such you should correct incorrect capacitance of the pi net work, or you could end up arcing out your 3 ganged air capacitors.

The forum has very good and experienced techs and parts guru. If you want to learn and have patience you will be helped.

You can turn the power output down using an external 9v battery pot and cap. Mike w5rkl and Terry k9tw have provided this Info many times. You can search the history of email in the file section.

I always teach new folks when making that initial plate current dip in Tune mode to pre-set the Plate Load control plates fully meshed ie full CCW so that there is no or very little transfer of RF current from the Tank to the connected 50 ohm dummy load that is in parallel with the Plate Load cap. As Butch stated this provides a very nice discernable dip in plate current (Ip). That of course doesnt mean that you leave the Plate Load control fully meshed.

Some folks then place the mode switch to CW position and instead of placing meter in RF relative power position they leave meter in IP and recheck and re-dip the plate current again. That is not necessary and the manual doesnt tell you to do that, but it doesnt hurt to do so if you want to. Dip and load folks do this out of habit.

Manual tells you after doing the plate current dip in Tune Mode to place the meter in RF relative power position and alternately adjust Plate Load and Plate Tune capacitors for maximum RF relative power. If the meter pegs full scale simply adjust the RF relative power sensitivity pot on rear panel to bring meter indication back on scale. Usually around 2/3 is good point to allow you to see a peak in output rf voltage. Peak in RF voltage or peak in output power on an inline wattmeter is much more readily apparent as you load upwards of 100 watts than trying to see a dip in Plate current as you load heavier.

My question is..... You state the moment you just slightly advance the Plate Load cap (turn knob CW) after doing the plate current dip with Plate Tune cap that the meter "will go out of range". What meter position are you talking about? Is the meter still in the Ip position? If so, then there is a problem and DO NOT leave the rig keyed with Ip pegged. If you are following the loading instructions you should be in CW mode and have the meter in RF position after making the Plate current dip. Go to You Tube and watch Allan W2AEW video #153 on loading a TS830. He demonstrates the method described in your owners manual.

With experience you wont necessarily have to pre-set Plate load cap plates fully meshed and will be able to load on the fly very quickly. Can be done in CW mode, but not for beginners. I still make initial dip in Tune mode after all these years of loading. KW gave us the reduced screen grid voltage position so best to use it.

One thing you may want to check is the alignment of the Plate Load cap and Plate Tune cap with their knob positions. It is not uncommon for the couplers to become loose. Also check to make sure that the Plate Load cap plates have no axial plate movement. Sometimes the rear rotor pivot point locking paint has broken loose and the adjustment screw has backed out and when you thrust the shaft back and forth gently the gap between the plates changes and the plates can actually touch and short out.

Hi,
Thanks guys for all your help. Thanks Dave for the info on how to take off the front panel. The Mode switch is now nice and tight on its seating but nothing has altered . ...back to the drawing board :0)

Mike thanks for the info for the QRP mod just my cup of tea, a nice easy mod!

Here are the new Checks I have carried out.

First using dummy load.
40m ..... Mode switch in Tune position adjust drive All works OK.

I have to switch to CW and VOX as the tune position is inactive and the send switch does not activate anything!
Morse key down and set the dip on the plate.
Morse key down and adjust the Load . 100 watts is about one white dash of load 18deg?
20 Mts..... same procedure as above 100 watts is about 3.5 white dashes 60deg? (11 o'Clock).

To get the output in watts I have to switch to an antenna and read off the power on the ATU.
Two more questions do I have to wait before turning on/off the heaters? also when do you tune your antenna . I use a multi band antenna and a balanced ATU. I imagine after you have tuned up into a dummy load?

Richard G0ILN.

"potentiometers" (I hate auto-spelling software, too.)

> https://www.youtube.com/watch?v=0QvOepREO4k

Oi.

I don't think I've seen that much wasted cleaner ever before. And he didn't remove the massive quantities he over-used with anything; not compressed air, not "canned" air, not even a good whoosh with his breath (NOT a recommended procedure).

After doing this kind of stuff since before high school, and also having listened to the advice that keeps coming in here on the mailing list, I recommend a somewhat less .... gung-ho (?) approach.

Just because a spray can has a tube that fits in the nozzle doesn't necessarily mean that it ought to be used.

Don't know about anyone else here, but another thing is the bloody COST of DeOxit anything. I simply can't afford to just waste it like that guy was doing.

DeOxit D5 is more meant for switch contacts such as the SG or heater or band switches in your radio.

DeOxit F5 is for "faders" (hence the "F"), AKA "potentiometers" - "pots" for short. It is mostly the same as the D5, but contains a lubricant component to make the pots move more smoothly, or so says the ad hype.

Both work well, but you do NOT need anything like the quantities the guy fixing that guitar amp used. Not even if there was a mouse nest inside the case.

Spray a SMALL amount into a clean cap, 'watch glass,' or other sort of small container. Use the tube nozzle extension and the lightest pressure on the can valve to get it just barely flowing out of the can. Don't dispense more than you can use at a go; I do one swtich or wafer at a time, or one pot at a time.

I use a toothpick to apply it to open contacts like the band switch of my 520SE, For things like toggles or slide switches, if there is a hole I can use to get to the contacts I use a small child's watercolour paint brush, trimmed short, thin, and slightly stiff to daub on the smallest amount I can

which will still clean the contacts.

Work the switch or pot through its range several times immediately after applying the cleaner.

Then, and this is the important part, blow the cleaner out of the switch or pot using compressed air if you're lucky enough to have a bench supply which will provide it, or a can of the "canned air" which you can find at about any department or hardware type store. Work the switch/pot through its range while blowing the cleaner solution out.

As another good reason not to use a bunch of cleaner, or leave it wet inside the device, a lot (MOST if not all) of these cleaners are somewhat flammable. A spark from turning the thing on can quite easily cause a really nasty fire, and dirty pots will suddenly become the least of your worries. Also, these cleaners, ALL of them I've seen, are really bad for your health. Don't breathe the fumes, check the precautions on the can and follow them, that sort of thing.

The other top-shelf technicians in here can add to or correct this as they see fit, but the basic procedure is what I use, successfully thus far. (And as a side benefit a can of D5 or F5 lasts me a LONG time, and not just a couple of cleanings.)

Bob,
Most pots do not require removal to clean them.

I use both D5 and F5 cleaner on pots and wafer switches. Quite often inexperienced people apply excessive amounts of contact cleaner whether it's DeoXit or other brands. There are a few videos on Youtube showing people applying excessive amounts of cleaner. Do NOT follow those videos!!

I clean pots by pointing the F5 Fader cleaner/lubricant can's small red tube at the opening at the base of the pot's 3 terminals and "gently", emphasis is on "Gently", press on the can valve until I hear slight spray. I then release the value stopping the application of the cleaner/lubricant. Not all pots have the opening. Wire wound and some special built pots (Drake's CAR Null pot is typical of a special built pot) typically are sealed and can't be cleaned.

Once a very small amount of cleaner is applied to the pot, I rotate the pot throughout its travel 3 to 5 times.

Next I use generous amounts of canned air to remove cleaner residue. Canned air is available at Walmart's TV/Cellphone department. You can use compressed air in place of canned air. Do NOT turn the canned air upside down or sideways as the white propellant is very cold and can burns to sensitive skin. The canned air can will turn cold when used, that's normal. DO NOT shake the canned air can!! Read and abide by ALL warnings on the contact cleaner and canned air can labels!!!! DeoXit has both flammable and non-flammable contact cleaners so pay attention to the D5 and F5 you have.

Once cleaning is completed I test the pot. If the pot is a replacement pot that has not been installed, I test the pot by connecting an ohm meter between the pot's center terminal and one of the pot's other terminals. I rotate the pot and watch the ohm meter. A clean pot will display a smooth change in the Ohm meter's display. I use analog VTVM/FET Ohm meters such as a Heathkit IM-18 and IM-5228.

If you are going to service your ham gear then you will need to obtain some basic test equipment. If your troubleshooting skills are limited to possibly non-existent then you should spend time learning Basic Electronics. I recommend purchasing John T. Fryes "Basic Radio Course". You can purchase the book on CD
eBay ad #200692897318
price $8.99 plus $2.50 shipping. I highly recommend the book. I'm not selling the book on CD nor do I have any interest in the seller. I did purchased a copy of the CD plus I also have a hard copy of the book. Your local library may have the book. Also look at used book stores, that's where I found my hard copy. Amazon.com also has a few copies so check them.

Thanks gentlemen;

I unscrewed the pot to gain access to it. The tiny spray idea did not work, I did get a good shot in, but not running all over the place. I worked it back and forth, then blew it out and waited for it to dry out.
Results : There is an improvement, and it seems to stay on 60 once adjusted.
Going to step #2, tune position and ALC, adjust drive....meter still show about 25 and does not move when drive is turned.
Went back to step #1, LSB position and IP, checking again, and no longer at 60 ma, now 50

I did this several times and the 60 ma was almost always different each time. I will let it set for a while to make sure of discharge, and clean the pot one more time. This rig may have more problems, but I would like to give a try at fixing them. It is always a good thing to learn !

I was an Electrical Engineering student in college, but only got as far as my first year and then got drafted into the Army back in 1972.

Richard,

If you haven't already gotten this suggestion (didn't see it in the thread), the problem here in my opinion is the resistors which set the TUNE vs. CW power output, on the RECTIFIER unit. I have had two hybrid rigs (TS-520 and TS-830S) where the resistors on the rectifier unit had degraded, and where I had similar symptoms (namely, there was no way to dip the plate in TUNE mode, only in CW with a key down). After inspection, one had a resistor which was unstable (probably a bit toasted), and the other was WAY out of spec. One resistor had slowly faded away after some exposure to moisture at Field Day, the other one had been out before I came into possession of that particular rig.

It looks like on the 530 these are R15 and R11... Follow the TUN position setting on the schematic. It might be worth checking the other resistors on the rectifier board (power off and unplugged of course - HV down there), as if one is going, the others might also. R15 is a 56k 1/2W resistor, R11 470 1W resistor.

The "TUNE" switch switches in a resistor (into a voltage divider network), which reduces the output to the finals stage during tune up. When that resistor is bad, it either drops the output on the finals to near zero (so you get almost no IP reading), or it just runs full power. Either way is not what you want.

Anyway, hope this might help.

Richard,

Ben is correct. Sorry I didnt address, but sending messages from phone isnt the best.

R15 and 16 are 1/2w 56K resistors which have either blown or have gone out of spec, they are two carbon resistors. If you look at the circuit diagram for the rectifier board, you can see that the 56k resistors are switch in when in tune mode. You can use the newer metal film type resistors. The best part about replacing these resistors is you can unscrew board and then gently fold over and replace them. I always do both resistors But when screwing board back down make sure you dont pinch or catch any wires under the screws. This normally fixes your tune position problem. Then you can start from scratch with proper tuning/load of your radio.
If you follow the advice already given it is easy. I suggest alway tuning into dummy laod through a good know watt meter, this way you can see your output.

After inspection, one had a resistor which was unstable (probably a bit toasted), and the other was WAY out of spec. One resistor had slowly faded away after some exposure to moisture at Field Day, the other one had been out before I came into possession of that particular rig.

It looks like on the 530 these are R15 and R11... Follow the TUN position setting on the schematic. It might be worth checking the other resistors on the rectifier board (power off and unplugged of course - HV down there), as if one is going, the others might also. R15 is a 56k 1/2W resistor, R11 470 1W resistor.

The "TUNE" switch switches in a resistor (into a voltage divider network), which reduces the output to the finals stage during tune up. When that resistor is bad, it either drops

the output on the finals to near zero (so you get almost no IP reading), or it just runs full power. Either way is not what you want.

Anyway, hope this might help.

Hi,
i have probably worn out my welcome . But I know now it is not my inability to tune the radio it is a fault within the radio! The send switch only works on Mode setting TUNE and you can tune the Drive.

The send switch is dead on CW, USB , LSB. To set the plate and load you need to use the Morse key with the VOX button pressed in. And the Mode has to be CW.

Sorry to be such a pain If anyone has any ideas as to what the problem is I would appreciate a reply.

Topic: 54816 Message: 54816

Hello All.

This is my first post to the forum, but I've been an member for some time now.

My TS-830S is having some problems keying up in CW....

Putting the radio in CM mode, and turning on the VOX, when the straight key is closed I get intermittent keying. As an example if I hold the key closed you'd expect one constant carrier, or tone, to be sent, but this is not the case. At moments the radio doesn't key at all, and sometimes it keys very briefly then goes back to receive even with the key closed. The delay time makes no difference either.

Also, the side tone died too. It only sends a very feeble beep and only sounds for a fraction of a second regardless of how long the key is closed.

I did an experiment using a shortwave receive. While listening on the S/W radio, I keyed the 930 with the send/rec switch and tapped the straight key and the radio did send characters. But, the higher the power (about 30 watts) the tone became warbley.

SSB works just fine and I had several QSOs today with good reports. VOX on SSB works fine too.

Any insight into this is greatly appreciated.

Thanks
Joe

OK folks, I left the rig running for an hour and the 60 ma is still there. Maybe the Deoxit worked. Now on to the next problem, how do I fix the drive. It stays at about 25 on the meter and will not adjust with the drive knob.......Maybe new tube ? I can swap one from another rig ?

Richard,
The web switch when in San mode will only work when you speak into Mic.
If you have a key plugged in, try removing key, turn off vox and see how you go from there.
As I don't have a key plugged in can't verify either way

Hi Wes,

You are absolutely correct with your comments. I did not watch the video in it's entirety. I spot watched here and there. It was intended to deminstrate the "BASICS" of how to clean a pot. Next time I will watch the entire video before posting. After watching all of it, my jaw fell. Sorry folks. Please disregard the post I sent to help Bob.

I have been telling him the same thing a week ago about the BIAS pot cleaning and other things on private emails because I was not yet allowed to post on the forum. The issues have again been followed up with a lot of postings the last few days.

When Bob asked how does one clean the BIAS pot with the cleaner, I became speechless..... So I thought I'd also try to help. Oh well, bad Utube video to use as an example. Sorry Bob.

Tony

Look at the resistors...That is your problem with TUNE.

What you describe is NORMAL. When you flip "SEND" on CW, and you have a CW key connected, you won't get any output until you key down with VOX -- that's the normal behavior. You can verify this by unplugging your CW key from the back of the radio, and flipping "SEND" will then output full power.

On USB/LSB, even with "SEND" flipped, you need mic input for any power output. This is not a problem, that's how the radio works.

You only have one problem: the TUNE resistors.

Status as on today

1. Removed RF board because something from TP1 to Q1 was sinking signal. There was good signal at Molex connector when removed, indicating path from SO 239 to Molex connector is good.
2. L41 and/or BCB are suspect
3. Q1 already removed from circuit.
4. Measured in circuit DC resistance of L41
5. Primary 0.20 Ohm. Secondary also 0.20 Ohms (approx)
6. No primary secondary short.
7. Primary resistance from ground hot end 0.2 Ohms.
8. Secondary resistance from ground 990 Ohms. Must be because of R43 1K.
9. I am using my MFJ 259B with a 4 feet RG58 as signal source. Shows output of some 15 millivolts. But 1.5 volts directly at output. 10 Megs DMM with a single diode home made RF probe.
10. Before I finally remove L41 from board, can I do any further testing ? Else I am mentally prepared to take out L41, test it for DC and Inductance (again 259B)
11. Documented DC resistance for a good coil for primary is 0.25 ohms and secondary is 1.00 ohms.
12. As per guidelines by K9TW and others, I MUST verify L41 for step up action before putting it back on board.
13. I should also verify board integrity from TP1 to the base of Q1 for good signal (3 to 4 times increase in RF volts).
14. I have a spare 3SK73. Untested. Removed from some old Yaesu RX front end. Would you advise I test it before soldering in ? I can only do a DC check for pin to pin ohmic resistance.

Thanks

Rahul

Turning VOX to ON in CW mode then pressing the CW key does 2 things
1. Produces a CW side tone that's fed to the VOX circuit, switching the hybrid to transmit in the same way as side band voice VOX does2. Reduces the Grid Block keying voltage to a lower level, activating/turning on various circuits to produce RF output.
The operator can flip the SEND switch UP, have a CW key plugged into the rear panel CW KEY socket, then press the CW key, RF output will occur, assuming the CAR control is set for RF output. When using this method, VOX does not have to be turned ON.
Leaving the SEND switch DOWN, turning VOX "ON" and pressing CW key will result in the hybrid switching to transmit and produce RF output. The CW side tone produced by pressing the CW key, is applied to the VOX circuit in the same way side band voice using VOX does. The VOX relay amp turns ON causing the relays to energize. The length of time the relays remain energized is determined by the VOX DELAY setting. This method requires VOX to be turned ON.

From: carlos@...
Topic: 54824 Message: 54824

When I tune the drive coils, is the plate supposed to be set at 12 o'clock or the band range for the band I am tuning. The reason I ask is that on all bands except 20m the indicator is way off. I'm using a HK dummy load can.

Band Plate dip Max power
20 14m section same
7 6 o'clock same
3.5 6 o'clock same
1.8 1.8 section 7 o'clock
21, 28, 28.5 12 o'clock 12 o'clock.

Next question. Neutralizing the finals
With a HK IM18 VTVM meter, I take I use the RF probe not the AC/DC probe? Where do I set the meter, ohms? Do I connect the probe to the phone jack of the load? When I do this I see 50 ohms, is this what I am supposed to see? When I set the radio to send what am I supposed to see?
My power on all bands is around 60w and wondering if the tubes not being neutralized correctly could be a reason for the low power.

Not the smartest questions, I know.

Thanks
Carlos

Joe,

I suspect the electrolytic caps on your VOX board are having issues, which is causing issues with the timing on the key down. (that, or a problematic relay.. hope it's the electrolytics).

Easy things to check:
1. Clean all your connectors 2. Try using the key with "SEND" flipped and see if there are still issues -- will help determine if it's your VOX circuit or something else. 3. Clean your VOX control pots.

However, since you describe your side tone no longer working, I'd highly suspect electrolytic cap degradation. I had the same issue on my own TS830-S (my side tone started out going everywhere, then eventually died) at the same time my VOX stopped working. Fix was re-capping the VOX and sidetone circuits (all in the same part of the world). I think most electrolytics on the Kenwood hybrids are hovering near their expiration date. (I wouldn't wholesale replace these, but not surprised.. you might choose to recap the big filter/power caps at the same time to prevent bigger issues, if indeed you are finding electrolytic problems elsewhere in your rig).

Anyway, hope this helps.

Ben

Subject: [TS-520_820_530_830] Tuning up problems

Hi,

I have just bought from an SK sale a TS530sp . This is my first foray into Tube radios (Except for home brew gear).

Receive is OK but I have problems Tuning up.

1/ Set mode sw to Tune . Set meter to ALC adjust Drive . OK.

2/I can't dip the Plate in the Tune mode. Meter on IP setting.

The only way I have found to get output is to turn on the VOX set the Mode switch to CW and use a Morse key. The send key only seems to works on Tune setting.

My Mode switch is wobbly (Broken?) and I have used spray cleaner on the switch .

If I want to inspect the Mode switch how does the knob come off?

Any help would be most appreciated.

Richard G0ILN

Well folks, I have to admit to a bit of operator error. When adjusting the “Drive” I did not have the “CAR” adjusted. Now the rig is putting out about 100 watts on 40 meters. There is still a bit of an issue with the 60 ma. I have it operating on 40 meters LSB and I have adjusted the pot for 60 ma. Fine business. Came back today, turned the rig on, and there was 60 ma, GREAT ! The next question I have is this, if I turn the switch to USB or CW the 60 ma changes. That does not seem correct. Am I doing something else wrong ?

Robert Holland, KG6DHQ

hi All,
Many thanks to all who have helped me over the last few days. The TS 530SP is now working as it should! the problem was R15 on the Rectifier board. Sticking to the old adage if it ain’t broke don’t fix it.

I bought new resistors for R11 and R16 but did not fit them just in case I damaged the board. Whilst I was buying electronic components I also bought the parts to make the QRP plug in assembly.

Oh by the way John ...K8JD The rig did not come with a microphone and I will probably never need one!

A big thank you to everyone who has helped me get this old rig back on the air.

Thanks all especially Dave and Ben. I am sure you are both right and it is R15 & 16 on the rectifier board that have gone , it makes sense . I have found them on page 11 of the service manual so I will let you know how I get on.
Richard G0ILN.

All,

I found and fixed the issue. R13 on the rectifier unit was going bad. It's a 100K ohm 1/2 watt resistor that when removed measured almost 1M ohm. I started out measuring voltages on Q1 on the AF unit but measured less than one forth of the suggested voltages, so I moved to STB on the rectifier unit. When measuring STB on the rectifier unit it measured 28 volts opposed to over 100 volts that is should be. This indicated it's either R12 or R13. R12 looked fine, but R13 looked glazed and very slightly discolored. This is probably due to the fact it had not totally failed.So I pulled and replaced the resistor.

After replacing the resistor the radio functions as it should.

Hope this information benefits other in the future.

That is how Semi Break-in works.

The CW side tone produced in CW mode by pressing the CW key or keyer paddle, is fed to the VOX circuit.

VOX works with both sideband and CW.

The CW side tone, in CW mode, applied to the VOX circuit, will trip VOX switching to transmit The CW key is also connected to the Grid Block CW keying circuit. When the CW key is pressed, the Grid Block DC voltage is reduced, turning various circuits ON, producing RF output.

Grid Block keying voltage is used to bias circuit ON and OFF by changing the level of Grid Block bias voltage. The lower the Grid Block voltage (CW key pressed) turns the circuits ON. Releasing the CW key increases the negative Grid Block voltage (CW key released) turns the circuits OFF.

You can connect a DC volt meter across the CW key. Note the CW Grid Block voltage. Press the CW key and note the Grid Block key voltage becomes "less"turning on CW side tone oscillator and various other circuits resulting in RF output. Release the CW key and the Grid Block keying voltage "increases" turning the CW side tone oscillator OFF and turning other circuits OFF resulting in no RF output..

Older methods of CW keying use "Cathode" and "Differential" keying. Both have high DC voltages on the CW key, approximately 100VDC or higher.

Cathode keying typically keys the cathode of the oscillator, buffer, and final stage. The Heathkit DX-35 and DX-40 uses Cathode keying. By lifting the cathode of a stage turns that stage OFF. The CW key is a simple "switch" that lifts and shorts the cathode from/to ground turning the circuits OFF and ON.

Differential keying uses a time sequencing method of keying. Pressing the CW key results in turning the Oscillator on a few milliseconds first then followed by later stages, multiplier, turning on next. The Heathkit Apache TX1 uses Differential keying. The voltage on the Apache TX1 CW key is rather high, -135VDC in the Apache TX1. The negative keying voltage is applied to the grids of the xtal oscillator, VFO, and multiplier. By closing the key the negative keying voltage is reduced, turning on the various circuit on in a time sequence interval.

Cathode and Differential CW keying does not produce a CW side tone nor does it use VOX. It's the "older" way of CW keying. The side tone was heard by allowing the receiver to remain active, not muted, and tuned to the transmitter's frequency. I used this method in my Novice day using a Knightkit T-60 xtal control transmitter and a BC-312N receiver. The receiver was never muted only the antenna was disconnected.

Hi All first post here,

I recently bought a TS530s my new toy had a wobbly band switch I decided I want to keep the boat anchor and do every single upgrade possible,I bought just about everything from K4EAA except for the dial and driver tube,

I've replaced the plastic cracked coupler with the brass one and no longer have to wiggle the band switch to get a dial readout and receiver going , the switching action is firm. However I now do not have 160m when I select that band ,there is no readout or receive on 160m.

While I replaced the coupler I did follow the band switch pdf and did a full removal and clean of all wafer switches, I did find one contact that was high resistance so I cleaned and soldered over the rivet which fixed that, I ensured that the white dot was at the 9 o clock position on reinstallation so I'm a little lost on why I've lost 160m.

I've had another intermittent fault where there is no receive or freq display on any band when powering on , I think I found a connector at fault there I did the old push down with a screw driver on a connector trial and error elimination till the fault cleared so now I'm looking at pulling the rf board back out to clean the plugs and sockets, the two under the vfo area are a little easier to get to now that I've replaced the HV caps but I'm thinking of removing that vfo board above them first this next time,

So I'm looking for anyone's advise from experience on why I've lost 160m ,,

Currently working on the IF board ,,screen caps are out as is the relay all waiting for me to complete all the little electrolytic caps tonight,,,which brings me to another dilemma of whether or not to buy optional filters ,, this rig is going to be my pride and joy boat anchor so I do know I want to have them both in there just need to zap my visa card again.I noticed under the IF board that someone has isolated some grounding area by cutting tracks not sure if that's standard or not.

Another item of interest ,, when I first turn the radio on the s meter needle slams full scale deflection and then settles back down as the receiver comes on,,,any ideas on that one ?

After the IF board and revisit to the RF board I'm going to the rectifier board to install new caps and have a look around then I'll probably reassemble and see where I'm at,

All comments more than welcome

Kind regards

Paul

Well guys, maybe I got it. Sprayed a little Deoxit on the waffer switch and worked it around a bit. Then I got out the 820 operating manual to make sure I was doing everything correctly...did a bit more than look at the pictures. I think the 60 ma improved a bit, but will keep an eye on it. Went through all the tuning steps (correctly) and now it is putting out 130 watts on my watt meter in CW. I will keep it on the work bench and check it a few more times, then it will go in the shack and on the air !

Thanks everyone,
Bob Holland, KG6DHQ

820/60 ma problem; Robert Holland

Again thanks to all for your help and ideas, but I still need some more ideas. My 820S is now useable, but there is still a problem with the 60 ma bias. I can turn the rig on and let it warm up, then adjust the 60 ma. I hit the send and watched the meter and I could see tiny movements. It still will not remain stable. Yesterday I adjusted it in the LSB position, and turned it off. This morning when I turned it back on, 60 ma was ok. I went through the tuning steps and then went back to check the 60 ma again and now it was 50. I have sprayed the pot and also the selector switch, and there is a small amount of improvement.
Anyone have any ideas on a fix for this ?

Robert Holland, KG6DHQ

On the TS 820 You have to use the cw key input to tune the plate in cw mode. Tun position only lets you set ALC with drive control. If you have a key plugged into the key input you have to close it or put a keyer in the tune mode. If you don't have anything plugged into the key jack on the rig then it is a self closing and will key the final for tuning without the side tone. It DOES have to be in CW mode for tuning final.

Hi Carlos,

I don't know your skill level or experience with
these radios so bear with me, I'm only trying to help.

The plate control has no bearing on the drive
coil adjustment. I recall someone else having a
problem with the pointer on the plate control.
You will have to search through earlier posts to
see what causes that. It could be a mechanical problem.

You should set your VTVM to DC volts when using
it with an RF probe. In this way you can measure
RF at the output of the PA. The aim is to adjust
TC1 for minimum RF. It is unlikely that this
would have a serious effect on output power.

You did not give any details of the operating
conditions of your PA such as HV and plate
current. If your meter in the rig is reading
correctly you can use these values to confirm
your PA is working correctly. Mike, W5RKL has
posted several times on how to calculate output
power based on these meter readings.

Let's assume your dummy load is ok (you said 50
ohms) and we'll take PA efficiency as 60%

Tune your rig on CW into your dummy load and take
note of the key down HV and IP - for this
example we'll say you got 790V and 200mA

Do the math = 790 x 0.2 = 158W You're in the
ballpark because your rig is rated for ~ 160W input

Now multiply by PA efficiency = 158 x 0.6 = 94.8W This is a reasonable figure.

If the rest of your rig is ok then you need to do
this quick check may give you a pointer to why
your power output is low. Note this test is done
on CW. You cannot easily determine output power
using this method if you are on SSB. You did not
say how you were determining you output power.

Good Luck

Lou

The level of RF voltage at the plates of the 6146s can easily exceed the typical RF voltage limit. The Heathkit PK3 RF probe, for example, has a maximum RF voltage limit of 90 volts RF and the 6146 final amplifier RF output can easily exceed that level.

Most RF probes require the VTVM to be set to measure "Negative" DC voltages. This is true with the Heathkit PK3 and other RF probes. My home made RF probe requires the VTVM to be set to measure negative DC voltages.

Final amplifier DC "Input" power can easily be calculated using ohms law formual

P = I x E

where

"P" is the unknown input power
"I" is the "IP meter" indication after tune up
"E" is the final amplifier HV

For example, assume the IP meter indicates 220ma and the HV indicates 750VDC, the DC input power is approxiately 165 watts. The typical KW TS-820 hybrid CW mode DC input power is 160 watts.

The final amplifier operates in Class AB1 which has an typical maximum efficiency of 60%. therefore, subtract 40% from 165 watts input which should results in approximately 99 watts output into a 50 ohm dummy load. This assumes the TS820 is aligned to factory specifications and the driver and both final tubes are strong.

Most watt meters hams use are average power watt meters. The kw hybrid's "REL PWR" meter switch setting is not a watt meter. The typical average watt meter indication on side band with a properly adjusted MIC gain control will be between 25 and 30 watts on voice peaks. This does NOT mean your KW hybrid has a problem. It simply means the average watt meter cannot keep up with the constant changing up and down, of the RF signal. Only a Peak Reading Watt meter can provide a higher PEP indication.

If your watt meter indicates 150 watts output from your KW hybrid then you need to check the watt meter and dummy load because the typical KW hybrid is not designed nor an it produce outputs at that level

Welcome to the Yahoo Kenwood TS-520_820_530_830 Amateur Radio Group. This group is comprised of members who's interest is in maintaining and operating the Kenwood TS-520, TS-820, TS-530, TS-830, TS-510, TS-511, T-599/R599 and R820 Hybrid transceivers, transmitter and receivers. In addition, the group supports discussions covering the associated Kenwood accessories such as the VFO-520, VFO-820, VFO-230, and VFO-240 remote VFOs, the Kenwood antenna tuners, and the various Kenwood desk and hand microphones.

This is a restricted group requiring membership approval prior to receiving and posting messages to the group. To join the group simply complete the Yahoo Kenwood TS-520_820_530_830 Group's application process by clicking on the “+ Join Group” icon on the group's homepage. Select the desired method of receiving messages by clicking the appropriate radio button, then provide a brief description about yourself to include: your first name, your Amateur Radio call sign, your interest in the Kenwood hybrid radio, and the model of Kenwood hybrid you own, operate, or in the process of purchasing in the text box provided. If you are not a licensed Amateur Radio operator, no problem, simply complete the application process and provide the same information less the Amateur Radio call sign. Once you have completed the text, click the Join Group icon. Your application will be reviewed and approved by a group co-owner or Moderator. If you leave the application text box blank, your application for membership will be rejected. Simply reapply and provide the information requested and resubmit your application for membership.

New members are placed on a "Moderate" status. This means that any message a new member posts to the group must be approved by a group co-owner or Moderator before it appears on the group server for all members to see. The length of time a new member remains in a "Moderate message status" is determined by the members ability to adhere to, and follow the group's policies. The faster the new member(s) can prove they are adhering to, and following the group's policies, the quicker the new member's status will be changed to “Allowed”.

The “Allowed” status means the member can submit/post their messages without group co-owner or Moderator's approval. A member who's message status is set to “Allowed” may have their message status changed to "Moderate" if it is deemed necessary by a group co-owner or Moderator for one of the following reasons:

1. Failure to follow the group's policies after being informed by a group co-owner or Moderator
2. Knowingly violate any of the group's policies
3. Any improper behavior by the member that is deemed inappropriate by a group co-owner or Moderator

The group is moderated by both group co-owners and group Moderators. While we would like to have a group co-owner and/or Moderator present 24/7, that is not possible, as group co-owners and Moderators have a life too. Therefore, there will be times when a group co-owner and/or a moderator will not be present. This will affect the time a moderated member's messages may take to get approved/rejected. This occurs most often during major holidays Also, the group's server is not maintained by the group co-owner(s) or Moderators.

Therefore, when Yahoo has problems affecting Yahoo Groups, ALL members will simply have to wait for Yahoo to fix the problem. Group co-owners and Moderators also do not have any control over how the group's server handles attachments to messages or how message search results are provided.

Page 1

As stated above, this group has a set of policies that all members must agree to and abide by. If any member, new or old, that feels they cannot accept the group's policies, that member is free to terminate their membership at any time without notifying the group co-owners and/or Moderators.

Group's Policies:

1. Profanity of any type, regardless of the word and/or phrase(s) used in a message, is not allowed. This includes the use of abbreviation to improper words, use of symbols to substitute for letters, etc. In short, the use of profanity is NOT ALLOWED, PERIOD!!! The quickest way to get banned from this group is to use profanity!!!

2. Disrespect/Flaming any member regardless of the reason, is not allowed.

3. Taking over a thread by a member that changes the threads original subject and content, is not allowed.

4. Messages that contain as part of the message text, discussions of a member's private life are not allowed. Responses to messages are to pertain to the original message subject.

5. Long discussions that are products of an original messages are not allowed. If there are 2 or 3 members who wish to discuss a subject in more detail and at great lengths should take their discussions off the group and continue their discussions using private email addresses.

6. MESSAGES THAT DO NOT CONTAIN ACCEPTABLE MESSAGE SIGNATURES, WILL BE SUMMARILY REJECTED! It takes less than 5 seconds to ensure your message contains an acceptable message signature. There is no excuse for not adding a message signature to your messages. Political or religious signatures/statements are not permitted.

The following are examples of the ONLY acceptable message signatures:

Licensed Amateur Radio members:

Example:
“73s
John WA1ABC”

Non-licensed members

Example:

73s
Mary

If a member does not wish to include their Amateur Radio call sign in their signature, then simply use their first/given/Christian name ONLY, same as non-licensed members.

Each message signature must be positioned at the bottom of the message text and separated by at least one line.

For example:

Hi John,

Yes capacitor C25 is the right cap you should be checking. For details, review the schematic.

73s
Bill

Screen names such as JLH524 or MWPO125 are not acceptable message signatures. Screen names are acceptable ONLY when used as part of the member's email address.

The member's email address is not an acceptable message signature, regardless whether the member's name appears in the email address or not.

A member's “initials” are not acceptable as a messages signature.

A member may add up to 2 additional lines to their message signature. The additional 2 lines may contain a link to the member's website and a link to the member's Amateur Radio club etc. The addition of 3 or more lines to the message signature, listing the many different clubs the member belongs to, the positions they hold within the respective club(s), their professional position within the company the member works for, and other information is considered excessive and not allowed. The following is an example of an acceptable message signature containing two additional line:

In my latest response, in the first sentences I said:

"/The level of RF voltage at the plates of the 6146s can easily exceed
the typical RF voltage limit."

/What I meant to say was:

/T//he RF voltage at the plates of the 6146s can easily exceed the
typical RF "//_probe's maximum RF_" voltage limit./

Never attempt to measure the RF voltage at the Plate of the 6146 finals with a single or triple diode RF probe.

Must use the proper test gear. There are 100x O-scope probes that can be used like the P5100 and Capacitive voltage dividers like the HP-853A. You are dealing with 900vdc and approx 1500 P-P RF volts at 100 watts output. Most standard signal diode RF probes arent going to like either.

Even if the RF probe used has a 1000vdc block cap the PIV rating of the signal diodes would be greatly exceeded by the RF.

If you attempt to measure RF voltage at the Tank cap DC isnt an issue for your RF probe. However the RF level is. RF voltage across the tank capacitor is approx: Plate Dc volts X 0.90 X 0.707

This means at full load 825vdc x 0.9 x 0.707 = 525 rms RF volts or approx 1485 P-P RF volts. This is why you have the wide plate spacing. This is not a standard or typical Kenwood hybrid troubleshooting measurement. Even if you suspect a bad Plate Block cap better to measure at the SO-239 or across the dummy load. At that end of the Pi network looking at approx 71 volts if properly terminated in 50 ohms.

I have the above noted test gear and have measured RF across the Tank cap as an academic exercise and confirmed that it ranges from approx 525 to 545 rms rf volts, but this measurement is not typically needed for trouble shooting.

When running TX Level Diagram commonly would measure RF drive at the control grids of the 6146 finals which will be around 45 to 50 rms rf volts which means you need to use an RF probe like the Heath PK-3.

You can also see if you have RF at the SO-239 by using the RF relative power position of the panel meter. However, this isnt same as measuring.

If you want to measure the RF voltage to verify that you have proper level at 100 watts output then you can measure the IR drop across your 50 ohm dummy load resistor. Can do that by placing coax tee at the dummy load and use a 3 diode RF probe to measure from open center pin to shell. Should read close to 71 rms RF volts. Again using a 3 diode probe.

Of course a wattmeter isnt a high dollar expenditure and cant imagine not owning one to load my KW hybrids. Sure the rig is self contained with the RF relative power meter position, but much better to put a number on that RF output power. Loading into an open coax jumper will teach you that lesson. Plenty of RF relative power (rf voltage), but dummy load and/or antenna sure isnt seeing it. Plate load cap sure is!

Carlos:
Terry has a very good point. It is not good to blow your test equipment trying to get a measurement.
I thought we were talking about neutralization of the finals.
For this procedure you are measuring output with the screen grid switch to OFF position. Even this might be too much for some sensitive instruments.
You said you had a proper 50 ohm dummy load. Some of these loads have a plug to plug in an instrument such as an O scope, I don't know if your dummy load has a plug. If there is no plug, you can use a Tee connector, as previously mentioned. You are taking a reading across the output.
Again, we are just measuring "leaking" signal with SG OFF. This is pretty small even if the finals are badly "neutralized". I think a few watts would be quite a lot, it's probably less. Following the manual instructions, we are just looking for a minimum signal on our instrument, we are not concerned with the actual magnitude.
If you want to "see" your signal when running power and there is no plug on the dummy, wrap a few turns of wire around the outside of the coax. Connect O scope across this wire. This will enable you to see the signal but there is no way of calibrating it. It will be merely a relative reading.
I have damaged lots of test equipment by not being careful, please do not do the same thing.
Personally I would not worry about the different settings for tune up, as long as you are getting a good signal out. However if you want to have the plate at 12 o'clock, you probably have to go through the entire tuning process that is in the manual.
Wally KC9INK

54852. TS 530S poor receive. Suspect L41 blown.

From: yellow_kite@...
Topic: 54852 Message: 54852

Status as on today

1. Removed RF board because something from TP1 to Q1 was sinking signal. There was good signal at Molex connector when removed, indicating path from SO 239 to Molex connector is good.
2. L41 and/or BCB are suspect
3. Q1 already removed from circuit.
4. Measured in circuit DC resistance of L41
5. Primary 0.20 Ohm. Secondary also 0.20 Ohms (approx) (In circuit)
6. No primary secondary short.
7. Primary resistance from ground hot end 0.2 Ohms.
8. Secondary resistance from ground 990 Ohms. Must be because of R43 1K.
9. I am using my MFJ 259B with a 4 feet RG58 as signal source. Shunted with 10 Ohm resistor. Shows output of some 135 millivolts. Sinks to 13 millivolts the moment I touch probe at TP1. 10 Megs DMM with a single diode home made RF probe.
10. Before I finally remove L41 from board, can I do any further testing ? Else I am mentally prepared to take out L41, test it for DC and Inductance (again 259B)
11. Documented DC resistance for a good coil for primary is 0.25 ohms and secondary is 1.00 ohms.
12. As per guidelines by K9TW and others, I MUST verify L41 for step up action before putting it back on board.
13. I should also verify board integrity from TP1 to the base of Q1 for good signal (3 to 4 times increase in RF volts).
14. I have a spare 3SK73. Untested. Removed from some old Yaesu RX front end. Would you advise I test it before soldering in ? I can only do a DC check for pin to pin ohmic resistance.

Question is. Should I remove L41 at this stage ?

Thanks

Rahul

54853. 530SP and SG switch

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-06-02 18:20:56 UTC

Bought this radio a couple weeks ago and just found the intermittent in the 530SP transmit. The SG switch on the back of the rig is shot and I have another one on the way. It looks like a common switch would work, but thought I'd use a Kenwood part if possible.

My question is, since this was causing the 60ma idling current to drop out, could it have hurt the 6146's or other components? I only saw it happen once as I was transmitting, had just over 100 watts on CW, then nothing. It got to the point it wouldn't even tune up until I wiggled the SG switch around. Are there other components I should check?

BTW, the switch isn't just dirty or corroded, which was my first thought. It flops around like there is nothing inside it. Someone had placed a clip on the SG switch to keep it in the ON position but it was still intermittent. So I will replace it as cleaning would not solve it.

I'm just concerned if it could have damaged other components when it failed during transmit.

Thanks,

Tom, WA0E

Tom,

The SG slide switch is a SPDT switch that controls the final tube screen voltages.

In the "ON" position, the "Positive" Rectifier Unit's "210A" DC voltage is routed through the SG switch to the Final Unit's "SG" terminal and ultimately to pin 3 on each 6146.

In the "OFF" position, the "Negative" Rectifier Unit's "-C" DC voltage is routed through the SG switch to the Final Unit's "SG" terminal and ultimately to pin 3 on each 6146.

You can easily see this by viewing the TS-530 service manual's schematic.

You might ask Walter Dilley, walter.dilley@..., he may have one.

I forgot to mention. A failed SG switch such as you have described will result in loss of 6146 screen voltage, pin 3, to the 6146 tube socket. More than likely, as you have described the condition of the SG switch, the 6146 screen voltage is dropping to zero which is why you loose RF output and IP meter indication in transmit.

Loss of 6146 screen voltage due to physical and electrical internal connection failure in the SG switch results in the 6146 screens becoming "negative" in respects to the plates. When this occurs, electrons are repelled back towards the cathode resulting in loss of IP current flow and RF output from the final amplifier.

/Yes, I actually test the step-up voltage through L41 with a signal
generator & O-scope, and Terry does this too. I made a socket to plug
L41 into and then wire leads to the primary & secondary.
To remove L41, I _HIGHLY recommend using a de-soldering gun_, like the
Hakko. I have this one:
https://www.hakkousa.com/products/desoldering/hakko-808-desoldering-tool-6056.html
With the Hakko doing the de-soldering, the parts just fall off the
board! It makes repairs so much quicker, and avoid lifting the PCB foil
lands. There's nothing more worse than spending _more time repairing_
those lifter board lands.

Hey thanks everyone for the replay and sorry for taking so long to reply. I have been replacing resistors on the SB-201, that seems to be working just fine now.
My skill set is not where I would like it to be so I ask a lot of stupid questions sometimes more than once.

Well I was talking about both issues, the low power and the location of the pointer on the plate knob in relation to the band I am on.

Terry, I did remember your past comments to NOT measure plate RF voltage on the 6149s, I wish I had a 100x scope probe, I only have the 1x/10x probe.

I am using a Heathkit HM-2140A watt meter, I have compared the output to what am getting on my MFJ 993B and they are close enough to each other to be OK with the readings I am getting.

So this is what I am getting when measuring P-I*R
Band IP HV P=I*R P*0.6 Meter
10 0.150 850 127.5 77 50
21 0.175 850 148.8 89 65
14 0.170 850 144.5 87 70
7 0.175 850 148.8 89.2 65
3.5 0.17 850 144.5 86.7 50
1.8 0.2 850 170 102 45

I tried the VTVM at the RCA jack on the dummy load and I don't get anything with the RF probe, I tried all settings DC, -DC, AC nothing. I even tried with a T connector at the SO-239 with a coax that has jacks on it for testing. Nothing.

I do have extra tubes, I don't know the condition of them.

So this is where I am now.
Thanks
Carlos

Topic: 54858 Message: 54858

Greetings.
I've still got my 520s that I bought new in '78, and it's got the extension feet, as do my SP-520 and AT-200.
I just bought a VFO-820 and TS-820S to clean up and restore. Unfortunately, neither one have the extension feet. I've looked at the two main sites for hybrid parts, but I can't tell if any of their feet are the same height or will work.
Anyone have a suggestion for the extension feet? I will definitely need 4, and if I manage to pick up an SM-220 later this year, I will probably need a pair for that.
Thanks.

From: wagstw46@...
Topic: 54852 Message: 54860

DC resistance measurements on L41 are not very useful. Inductance measurements of the primary and secondary are more useful, but both are best taken with L41 removed and on the bench.

Primary R=0.26 ohms
Primary L= 0.86uhy
Secondary R=1.01ohms
Secondary L=15.5uhy

Inductance taken with slug core flush with top of shield can.

If you have the RF board removed there is no reason to remove L41 to test it. You have two good test points. TP-1 and VC-1 "S" solder lug.

1. Place the bandswitch shaft to 1.5 (observe the RF output and adjust the bandswitch shaft around the 1.5 location until get a good indication)
2. Place the Drive Control shaft so VC-1, VC-2 and VC-3 plates are half meshed. (this will produce max RF indication assuming coil pack alignment is correct)
3. Connect RF sig gen to TP-1 and one of the metal shield plates. Set RF sig gen for 50mv or -13dBm output. Remember that the output will actually be greater (2x) because the RF sig gen isnt 50 ohm terminated. You dont need precise signal level. Just need to see if peaks occur at correct frequency and peak is 6 to 8 times higher than 50mv.
4. Set RF sig gen for 2mhz.
5. Connect your RF measuring device (RF probe VTVM/DMM, RF millivolt Meter, Or O-scope to the VC-1 "S" solder lug and one of the shield plates for ground. The "S" lug is the 2nd one on VC-1 on the "small" set of plates.
6. You should now see approx 350mv rms at 2 mhz. Now slowly lower the RF sig gen frequency. Should see a sharp fall off of RF voltage around 1.6mhz. As you continue slowly down frequency should see a re-peak in RF voltage around 1.5mhz and then a very sharp fall off at around 1.4mhz. You are looking at the roll off of the BCB filter (high pass). If you dont see this then you may have lost L1 2.7uhy shunt inductor during inadvertant transmit RF incident. Note: If you go to my website you can see a sweep of the BCB filter action.
7. Assuming that the BCB filter works as it should next set the RF sig gen to 14.200mhz and 50mv. Set the bandswitch shaft to 14mhz and again move the shaft around for max RF indication.
8. Now adjust the RF sig gen frequency around 14.2 mhz for a peak and should see approx 400mv rms on your RF millivolt meter. (1130 p-p if using O-scope).

If you can duplicate these two tests then nothing wrong with L41 or BCB filter.

Next test would be to power the board and test Q1 RF amp. Can be done with bench supplies and/or batteries or a combo of both. A lot of good Q1s are replaced because signal injection/measuring wasnt done when board was in the radio.

Subject: [TS-520_820_530_830] introduction and band switch question

Hi All first post here,

I recently bought a TS530s my new toy had a wobbly band switch I decided I want to keep the boat anchor and do every single upgrade possible,I bought just about everything from K4EAA except for the dial and driver tube,

I’ve replaced the plastic cracked coupler with the brass one and no longer have to wiggle the band switch to get a dial readout and receiver going , the switching action is firm. However I now do not have 160m when I select that band ,there is no readout or receive on 160m.

While I replaced the coupler I did follow the band switch pdf and did a full removal and clean of all wafer switches, I did find one contact that was high resistance so I cleaned and soldered over the ! rivet which fixed that, I ensured that the white dot was at the 9 o clock position on reinstallation so I’m a little lost on why I’ve lost 160m.

I’ve had another intermittent fault where there is no receive or freq display on any band when powering on , I think I found a connector at fault there I did the old push down with a screw driver on a connector trial and error elimination till the fault cleared so now I’m looking at pulling the rf board back out to clean the plugs and sockets, the two under the vfo area are a little easier to get to now that I’ve replaced the HV caps but I’m thinking of removing that vfo board above them first this next time,

So I’m looking for anyone’s advise from experience on why I’ve lost 160m ,,

Currently working on the IF board ,,screen caps are out as is the relay all waiting for me to complete all the little electrolytic caps tonight,,,which brings me to another dilemma of whether or not to buy optional filters ,, this rig is going to be my pride and joy boat anchor so I do know I want to have them both in there just need to zap my visa card again.I noticed under the IF board that someone has isolated some grounding area by cutting tracks not sure if that’s standard or not.

Another item of interest ,, when I first turn the radio on the s meter needle slams full scale deflection and then settles back down as the receiver comes on,,,any ideas on that one ?

After the IF board and revisit to the RF board I’m going to the rectifier board to install new caps and have a look around then I’ll probably reassemble and see where I’m at,

&nbs! p;

All comments more than welcome

Kind regards

Paul

Hi Paul,
I used plastic waste pipe as extension feet.The pipe is about 1.5 inch inside diameter so it has a clearance on the original foot of about quarter of an inch. Paint the feet black and they look fine.
I have jacked the front of my TS 530 up by about 2.5 inches it is now a lot easier to see the front facia.
Richard G0ILN.

Terry thanks.

I have removed the L41 from the RF board before I saw your post.

Now what to do ?

Thanks

Rahul

Rahul:

Simple just excite it on the bench.

Can do that in step-up or step-down config. I would connect RF sig gen (MFJ-259) to the primary winding and measure RF voltage on the secondary.

Can connect on to the primary and secondary pins with mini-grabber or mini-alligator clip leads. With L41 upside down on the bench with two pins at the top and three pins at the bottom the primary will be two pins on your left and secondary will be two pins on your right. No connection to the middle pin of the three on the bottom.

Max RF voltage will occur at different frequency out of circuit as the windings dont see same parasitic capacitance as seen in circuit. Should see approx 8x voltage step up around 15.5mhz to 16.0mhz (depends on where you have the slug tuned core set.

So with 5mv or -33dBm injected into the primary should see a peak RF voltage across the secondary of approx 45mv at 16mhz. You may also find similar level peaks around 11mhz and 13mhz.

If you have digital LCR bridge can just measure the inductance of primary and secondary windings and if close to values I gave you in the first post then you know there are no turn to turn or winding to winding shorts and L41 is good.

Hello Terry

Thanks for tips. My only fear is that MFJ gives about 1.5V RF RMS out in open circuit and a little less when terminated with 50 Ohm resistor. Way above 5 mv. I hope I don't blow up primary or secondary of L41, assuming it is still good.
I would like to verify that RF injected at TP1 appears at L41 input without any loss, confirming L1 and other BCB circuitry is intact. There isn't a lot in circuit from TP1 to L41 anyway. This should be a fairly broadband circuit as tuning coils and VC1 have been isolated by removal of L41. I believe that with L41 and Q1 out of circuit, any signal injected at TP1, except BC band, should pass through without loss. I somehow am unable to achieve that, possibly because I do not have an accurate source of low RF at 50 Ohm. I have terminated my 259B with a 10 Ohm resistor and output goes down to 130 Millivolts. Will try to jig up a 50 Ohm 60 db T-Pad. Trying to borrow an LCR Bridge to measure L41 impedance, but if DC resistance is any indication, the secondary is short. I believe that with L41 and Q1 out of circuit, any signal injected at TP1, except BC band, should pass through without loss. I somehow am unable to achieve that, possibly because I do not have an accurate source of low RF at 50 Ohm. I have terminated my 259B with a 10 Ohm resistor and output goes down to 130 Millivolts. Will try to jig up a 50 Ohm 60 db T-Pad. Trying to borrow an LCR Bridge to measure L41 impedance, but if DC resistance is any indication, the secondary is short. But will verify impedance. Ideally I should follow your recommendation of testing board out of rig by giving appropriate DC voltages, before putting it back. I think I am pretty close to isolating the fault and solving it. I truly appreciate your support and help Terry and will revert with my findings. Regards

"Any" signal injected at TP-1 will not pass.

BCB is a broadcast band filter to prevent strong broadcast band stations from overloading the front end. I told you how to test it. Must use test signal above 2mhz and then go down in frequency to confirm that roll off around 1.4 mhz hasnt changed.

With L41 removed you are correct that you wont have to set the bandswitch shaft to the test frequency or peak the Drive control.

If you cant get anything above 2mhz from TP-1 to the primary winding trace where you pulled L41 to pass then couple of possibilities.
1. C1 1800 pf cap destroyed. (rare) Try injecting other side of C1.
2. L1 2.7uhy choke shorted turns (more common)
3. Open pc trace
4. Never seen bad 8.830 traps

I would like to integrate an electret headset to my 520/530. I did not think this was possible due to the audio degradation but I see and adapter being sold on ebay. It would take a 4 pin connection, two 1/8 female jack for the mic element and the ptt. Finally a battery box for 2aaa batteries.

1. How will the audio sound? The person selling says it will sound great. I know the kenwood mc 80 sounds awful on the 520s.

2. the two 1.5 batteries = 3v. Will that damage the radio? I guess you connect the 3.v to the mic element, and then to pin 1 and ground.

i would like to open my kenwoods up to the electret element, that would allow some experimentation.

Thanks for your time kb4mng

Brian,

I do not know what electret headset adapter you are referring to being sold on eBay that allows an electret microphone headset to be connected to a TS-520 transceiver.

The TS-530 has a microphone impedance spec of 500 ohm to 50K ohms.

The Kenwood MC-80 amplified desk microphone has an impedance spec of 700 ohms +/- 30%. At the high end of the percentage rating the MC-80 will present 910 ohms to the TS-520 speech amplifier which is well below the TS-520's 50K ohm microphone impedance spec. The MC-80 should work fine with the TS-530.

Most electret microphone elements have an impedance spec of 2K ohms or less. Attempting to use a microphone where the impedance spec is significantly different than the factory microphone impedance spec will affect how the transmit audio sounds. Also amplified microphones can produce distorted transmit audio quite often due to improper adjustments of the microphone GAIN and the transmitter's MIC Gain control.

I would recommend using a Kenwood MC-50 or a similar high impedance microphone with the TS-520. The MC-60 will work with the TS-520 if the operator changes the impedance switch to 50K ohms and does not over drive the TS-520 speech amp by improperly adjusting the MC-60 gain control and the TS-520 MIC gain control.

My MC-50 mic is unusable on 20M running Heathkit SB-200 amp at 500W, into a resonant 20M dipole.

Barefoot or other bands perfect. Cheap Midland handheld mic has no RF on 20M though.

I tried reversing mic lead wires in the base, no change. Any help would be great, thanks.

Hi Dave

My ts530s had a wobbly band switch so I replaced it with k4eaa brass one which is great the band selection now works fine except for 160m which has no read out at all.

During the repair of the band switch coupler I removed all the wafers and clean the contacts,,,I have no once again removed the RF board to inspect my soldering of the wafers,

It looks like I’ve lost 2 of the islands that the pins solder to , so im now trying to see if those two tracks are used as some wafers don’t use all pins,,if the ones I’ve solder sucked the islands off are used they must have through board connections I’m thinking.I may have to pin the holes I guess,

Unsure if I can post a picture to the group or if you can let me email you direct with a picture ?

Many thanks for helping

Kind regards

Paul

So I'm looking for anyone's advise from experience on why I've lost 160m ,,!

Currently working on the IF board ,,screen caps are out as is the relay all waiting for me to complete all the little electrolytic caps tonight,,,which brings me to another dilemma of whether or not to buy optional filters ,, this rig is going to be my pride and joy boat anchor so I do know I want to have them both in there just need to zap my visa card again.I noticed under the IF board that someone has isolated some grounding area by cutting tracks not sure if that's standard or not.

Another item of interest ,, when I first turn the radio on the s meter needle slams full scale deflection and then settles back down as the receiver comes on,,,any ideas on that one ?

After the IF board and revisit to the RF board I’m going to the rectifier board to install new caps and have a look around then I’ll probably reassemble and see wher! e I’m at,

&nbs! p;

All comments more than welcome

Kind regards

Paul

From: yellow_kite@...
Topic: 54852 Message: 54875

Thanks Terry

Status as on today.

Found that my mfj 259b and the RF probe were giving erroneous readings. Actually quite confusing. Could be because of impedance mismatch.

I connected my HF antenna to TP1 and tapped off after BCB, the input to L41. Initially poor results but on reworking the grounding of coax I found that signal on 20M was reaching that point. I confirmed that signal at that point was the same strength as at TP1. So the path from TP1 to L41 input is apparently good. Which also means that BCB circuit is OK. I actually tuned my RX, a Yaesu FT817ND, to around 1.5 MHz and signals did disappear confirming what you say and proving that BCB filter is working okay. Will also test the 8.83 MHZ traps traps this way.

So if I have a good L41 and Q1, the RX can be back to normal.

Tested L41 out of circuit with 259b. Both sides show no signs of any inductance. Fed primary with RF and no output seen at secondary. Almost 99 % sure that L41 is kaput.

Tomorrow trying to rewind L41. I have retrieved some 0.090 mm (Maybe No 41) enamel wire from some old inductor. Need some luck to get it done correctly. Keeping my fingers crossed. On the parellel also toying with winding a ferrite toroid as a backup provision.

But as suggested by you Terry, I will not put the board back till I have satisfied myself on all counts. There should be 8 times voltage transformation on L41 and the new 3SK73 should also be tested. As a final precaution will be a good idea to power up the board externally and verify output at the drain of Q1.

Thanks again Terry and Jan.

Regards

Rahul

54877. Hybrid Net Update (June 5, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-06-05 19:28:23 UTC
From: Mark Gilger
Topic: 54877 Message: 54877

For any that were not able to attend the Kenwood
Hybrid Dayton Forum last week, the presentation is posted on my web site at :

http://wb4hfn.com/KENWOOD/Hamvention_Forums.htm

We had 67 in attendance, which was about double what last years was.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started it's existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Saturday net was run by Mark, WB0IQK. There
were 13 stations checking in under poor
conditions. There were 2 new station checking in: N5ACR, and WB4WTN.

We had the following number of radios checking in.

0 running TS-520(x)
2 running TS-530(x)
1 running TS-820(x)
2 running TS-830S
0 running TS-510
0 running TS-511
0 running TS-515
0 running 599 twins
0 running TS-900

I was running my TS-830s and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
9 stations checking in under very poor band
conditions. There were 4 new stations checking
in: KD7MBV, W6CAW, N0OER, and K5LKT.

We had the following number of radios checking in.

4 running TS-520(x)
0 running TS-530(x)
0 running TS-820(x)
1 running TS-830S
0 running TS-510

0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and TS-940s,
which of course is not a hybrid, although over
30+ years old. Everyone is welcome as long as
they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 ☐ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday net total = 66, Sunday total = 46
December 2015, Saturday net total = 55, Sunday total = 73
January 2016, Saturday net total = 129, Sunday total = 81
February 2016, Saturday net total = 98, Sunday total = 72
March 2016, Saturday net total = 74, Sunday total = 35
April 2016, Saturday net total = 101, Sunday total = 57
May 2016, Saturday net total = 51, Sunday total = 32
June 2016, Saturday net total = 13, Sunday total = 9 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

Ok Paul email me directly and we can work it out.
If you have lost the fingers of island, that could be your problem. I would see if you can obtain replacement wafer switches for that section. If you do then would apply the solder to rivets for good electrical connection and prevention of future problem.

Subject: [TS-520_820_530_830] introduction and band switch question

Hi All first post here,

I recently bought a TS530s my new toy had a wobbly band switch I decided I want to keep the boat anchor and do every single upgrade possible,I bought just about everything from K4EAA except for the dial and driver tube,

I’ve replaced the plastic cracked coupler with the brass one and no longer have to wiggle the band switch to get a dial readout and receiver going , the switching action is firm. However I now do not have 160m when I select that band ,there is no readout or receive on 160m.

While I replaced the coupler I did follow the band switch pdf and did a full removal and clean of all wafer switches, I did find one contact t! hat was high resistance so I cleaned and soldered over the ! rivet which fixed that, I ensured that the white dot was at the 9 o clock position on reinstallation so I’m a little lost on why I’ve lost 160m.

I’ve had another intermittent fault where there is no receive or freq display on any band when powering on , I think I found a connector at fault there I did the old push down with a screw driver on a connector trial and error elimination till the fault cleared so now I’m

looking at pulling the rf board back out to clean the plugs and sockets, the two under the vfo area are a little easier to get to now that I’ve replaced the HV caps but I’m thinking of removing that vfo board above them first this next time,

So I’m looking for anyone’s advise from experience on why I’ve lost 160m ,,!

Currently working on the IF board ,,screen caps are out as is the relay all waiting for me to complete all the little electrolytic caps tonight,,,which brings me to another dilemma of whether or not to buy optional filters ,, this rig is going to be my pride and joy boat anchor so I do know I want to have them both in there just need to zap my visa card again.I noticed under the IF board that someone has isolated some grounding area by cutting tracks not sure if that’s standard or not.

Another item of interest ,, when I first turn the radio on the s meter needle slams full scale deflection and then settles back down as the receiver comes on,,,any ideas on that one ?

After the IF board and revisit to the RF board I’m going to the rectifier board to install new caps and have a look around then I’ll probably reassemble and see wher! e I’m at,

1, Can you read 5 ohms across cathode resistors? 2. Are the filaments lit on the Finals?
3. Are all the Final board screws snug? Back all off and re-snug, but dont strip out.

Have you checked the rear panel "SG" switch? That switch quite often
when handling the KW hybrids gets accidental pushed to the "OFF" position.

Bob,
The location of the "bias pot" on the schematic is as follows:
     Look at the diagram, just right of center near the top, you should see   "V1 : 12BY7A,"   look just down from there to find the symbol indicating V1, just below that is the "BIAS POT" symbol.
  If I may make a suggestion, go to Ken Kemski's web site: k4eaa"dot"comand down load a large format schematic for free...it really helps! I took mine to an office supply store and had them print it out , it's approx 32" wide X 18" tall...makes it much easier to trace out connections.

I HAD THE SAME PROBLEM WITH A RECENTLY ACQUIRED TS-830S. 60MA BIAS THERE;
THEN NOT THERE...I SEE YOU HAVE CLEANED THE SG SWITCH AND CHECKED FOR
CORRECT POSITION.
I SPRAYED AND CLEANED THE SEND/REC SWITCH. FIXED IT FOR SHORT PERIOD OF
TIME; THEN THE SAME PROBLEM. I CLEANED THE SWITCH FOR THE SECOND
TIME...ROCKED THE SEND/REC SWITCH BACK AND FORTH NUMEROUS TIMES. SEEMED
LIKE A HUNDRED TIMES...LOL.
NO MORE 60MA BIAS PROBLEMS FOR NOW.

MAYBE THIS JUST MIGHT HELP YOU.

REGARDS,

MIKE GEORGE/K3MG

Topic: 54842 Message: 54887

I guess the better clue is that he reports no 60ma zero signal plate current and no RF drive.

If that is accurate it would point to no final tube cathode emission or the control grid cut-off bias isnt switching to operating bias due to dirty RL-1 aux control relay contacts.

Thus the basis for my questions about cathode resistors, filaments, and good final board ground plane.

Might be good idea to monitor operating bias at the control grids.

Greetings!

I'm new to the group, but not new to Kenwood Hybrids - I've owned TS-530s, TS-830s and long ago, a set of 599D twins bought new. No funner rigs - ever!

I would like to acquire a nice set of 599A twins, would consider a TS-511 or -515. I'm not much of a technician - so plug'n'play, only. If anyone has one of these that's excess to your needs, please contact me off-line.

Topic: 54852 Message: 54889

Ok Terry.

Rewound L41 without much trouble. Usual precautions. However one pin of the former came off and had to be put back with superglue.

DC Ohmic tests okay. Approx 1.1 Ohm Secondary and 0.28 Ohm Primary. Will check inductance hopefully tomorrow.

Signal till the input of L41 is okay. Tested and done. If L41 tests okay on bench will put it back.

Then will solder 3SK73 after verifying signal at S lug of VC1.

Thanks Terry.

Will revert.

Ok Paul email me directly and we can work it out.

If you have lost the fingers of island, that could be your problem. I would see if you can obtain replacement wafer switches for that section. If you do then would apply the solder to rivets for good electrical connection and prevention of future problem.

Subject: [TS-520_820_530_830] introduction and band switch question

Hi All first post here,

I recently bought a TS530s my new toy had a wobbly band switch I decided I want to keep the boat anchor and do every single upgrade possible,I bought just about everything from K4EAA except for the dial and driver tube,

I've replaced the plastic cracked coupler with the brass one and no longer have to wiggle the band switch to get a dial readout and receiver going , the switching action is firm. However I now do not have 160m when I select that band ,there is no readout or receive on 160m.

While I replaced the coupler I did follow the band switch pdf and did a full removal and clean of all wafer switches, I did find one contact t! hat was high resistance so I cleaned and soldered over the ! rivet which fixed that, I ensured that the white dot was at the 9 o clock position on reinstallation so I'm a little lost on why I've lost 160m.

I've had another intermittent fault where there is no receive or freq display on any band when powering on , I think I found a connector at fault there I did the old push down with a screw driver on a connector trial and error elimination till the fault cleared so now I'm looking at pulling the rf board back out to clean the plugs and sockets, the two under the vfo area are a little easier to get to now that I've replaced the HV caps but I'm thinking of removing that vfo board above them first this next time,

So I'm looking for anyone's advise from experience on why I've lost 160m ,,!

Currently working on the IF board ,,screen caps are out as is the relay all waiting for me to complete all the little electrolytic caps tonight,,,which brings me to another dilemma of whether or not to buy optional filters ,, this rig is going to be my pride and joy boat anchor so I do know I want to have them both in there just need to zap my visa card again.I noticed under the IF board that someone has isolated some grounding area by cutting tracks not sure if that's standard or not.

Another item of interest ,, when I first turn the radio on the s meter needle slams full scale deflection and then settles back down as the receiver comes on,,,any ideas on that one ?

After the IF board and revisit to the RF board I'm going to the rectifier board to install new caps and have a look around then I'll probably reassemble and see wher! e I'm at,
&nbs! p;
All comments more than welcome

Kind regards
Paul

Yes it is not an easy task.

For me it takes a lighted magnifier head set and no coffee! I have broken the hair wire more than once!

I have the AADE IIB and a BK875 digital LCR bridge. I have seen some pretty low price Chinese units on Ebay. Some that measure inductance, capacitance, ESR, and test transistors for around $30.00.

Another way to test is with known capacitor and grid dip meter.

OK, I do not know if I am going out of channels, when I reply back to you. No, I do not know how to test for the presence of RF drive. One of the problems I am trying to solve is the 60 ma bias current. I turn the rig on and let it warm up. Now start going through the tuning steps. First check the 60 ma. It may show 50 or 70, so I adjust it for 60, then proceed. Next step is to adjust drive. Meter shows about 20, but does not move when the drive control is moved. So I go back to step one and the 60 ma is now some different value. If I leave it in the send position, you can see the meter slowly moving around. What would cause it to drift ? I am not real good with electronics, but could guess at a leakly cap or maybe the 12BY7A ?

Bob,

I had a very similar unstable idling current in my HW-101 6146 final amplifier. I am using my HW-101 experience ONLY as a similar unstable idling current issue. The problem turned out to be a very gassy 6146s as front 6146 arced in the base of the tube, pegged the PLATE meter (same as IP meter in the KW hybrid), tripping the HP-23A power supply breaker. I replaced both 6146As, problem of unstable idling current was solved.

Now the HW-101 never had loss of RF drive, there was always plenty of RF drive. I'm addressing only the unstable IP current which could be caused by a bad 6146B tube.

Bob, you can see if there is RF drive to the final tubes by placing the meter switch to ALC, DRIVE control to 12 o'clock, and CAR control between 10 and 11 o'clock and HEATER switch to ON. Set MODE switch to TUNE, connect the 820 to 50 ohm dummy load, then flip the SEND switch UP.

Adjust the DRIVE control either side of 12 o'clock. If there is RF drive to the final tube you will see a rise above zero on the ALC meter when adjusting the DRIVE control in TUNE mode transmit.

I might add if the SG switch is set to OFF you will still see the ALC meter (meter switch set to ALC) rise above zero in TUNE mode transmit. You will NOT see any IP meter indication in any mode if the SG switch is set to OFF which will result in zero RF output regardless of the level of RF drive to the final tubes.

Try that to see what ALC indication in TUNE mode you get.

I should also say that loss of ALC on 10 meters which could occur even with RF drive to the final tubes. I recommend performing the test I stated in my recent response on a lower band such as 40 meters. This should give a strong ALC meter (RF drive to the final tubes) indication in TUNE mode transmit.

Remember, ALC is produced when RF drive level applied to the 6146 final tube grids causes the 6146 final tube grids of the final tubes to become "Positive" (current flows between the 6146 cathode and 6146 grids). RF drive to the final tubes can still be there even when NO ALC meter indication is seen in TUNE mode transmit. I should have been more specific in my response.

Bob,

I suggest you locate a local "Elmer" to help you. Unless you have proper test equipment, you're just going to be "chasing you tail" trying to troubleshoot your problem.

Find someone with experience working with vacuum tube circuits. Troubleshooting one of these hybrid Kenwood rigs takes some knowledge of electronic theory and at least rudimentary troubleshooting skill. If you have neither, suggest sending rig to a qualified technician.

Steve, N6HK

I had a very similar unstable idling current in my HW-101 6146 final amplifier. I am using my HW-101 experience ONLY as a similar unstable idling current issue. The problem turned out to be a very gassy 6146s as front 6146 arced in the base of the tube, pegged the PLATE meter (same as IP meter in the KW hybrid), tripping the HP-23A power supply breaker. I replaced both 6146As, problem of unstable idling current was solved.

Now the HW-101 never had loss of RF drive, there was always plenty of RF drive. I'm addressing only the unstable IP current which could be caused by a bad 6146B tube.

Bob, you can see if there is RF drive to the final tubes by placing the meter switch to ALC, DRIVE control to 12 o'clock, and CAR control between 10 and 11 o'clock and HEATER switch to ON. Set MODE switch to TUNE, connect the 820 to 50 ohm dummy load, then flip the SEND switch UP.

Adjust the DRIVE control either side of 12 o'clock. If there is RF drive to the final tube you will see a rise above zero on the ALC meter when adjusting the DRIVE control in TUNE mode transmit.

I might add if the SG switch is set to OFF you will still see the ALC meter (meter switch set to ALC) rise above zero in TUNE mode transmit. You will NOT see any IP meter indication in any mode if the SG switch is set to OFF which will result in zero RF output regardless of the level of RF drive to the final tubes.

Try that to see what ALC indication in TUNE mode you get.

He reports that there is no RF drive.

That is why I didnt mention the SG switch as it has nothing to do with RF drive.

Perhaps he doesnt understand how to test for presence of RF drive?

Always best for new folks to do so with SG switch off so not needlessly involving the Final tubes (beyond cathode emission and operating bias) perhaps in an off resonance state for extended time.

Bob,

If I may make a few suggestions on some basic inexpensive test equipment. I'm partial to Heathkit basic test equipment since I have each one of the following equipment.

A Heathkit V7, IM-11, or IM-18 analog VTVM, or Heathkit IM-5225 (FET Multimeter). Probes, if are not included, can be made using RG-8x coax, 1/4" mono plug, and Velleman TLM6 RED and BLACK hollow plastic probes. My IM-18 did not come with probes so I made 2 probes, an AC probe (no series resistor required) and DC probe (1Meg 1/2 watt series resistor in the RED probe). The IM-5225 multi-meter are banana plugs with simple probes. I use mine for measuring DC voltages in various ham gear plus resistance measurements.

A DMM/DVM (Digital MultiMeter or Digital Volt Meter). I don't recommend those cheap Walmart and hardware store DMM/DVMs with prices around $10. There are plenty of DMM/DVMs on eBay. I have 3, an MU118, an Excel DT9205A, and a BEK 66B7000. The DMM/DVMs specifications can be found on the web. The DMM/DVMs I have all have a maximum AC and DC voltage rating of 1KVAC/DC. There are a number of DMM/DVMs that have a maximum AC and DC voltage ratings of 700VAC/DC. Those are okay but not good for measure high voltage in the KW hybrid 920VDC supply.

An RF probe such as the Heathkit PK3 (max 90 volts RF) or home made RF probe (see my website, http://w5rkl.com/equipment-photos/ for my home made RF probe). The RF probe shown on my website was made using 1/2" PVC pipe and end caps, copper tape connected to the probe's ground, the tip of a Velleman TLM6 BLACK hollow plastic probe, 3 NTE-109 diodes wired in series to ground, a .01ufd 1KVDC disc cap in series with a 4.7meg 1/2 watt resistor. The cable is RG-8x and the plug is 1/4" mono plug. Cost to build the probe was less than $10 (I had most of the components) only "slightly" more if you have to purchase all of the components (PVC pipe and end caps at your local hardware store).

A simple frequency counter such as the Heathkit IM-4100 (max frequency 30Mhz) or IM-2420 (max frequency 520mhz). I use an IM-4100 with my Heathkit Apache TX1 AM station as a digital frequency (transmit only). I also use a Sinometer VC2000 frequency counter (50hz to 2.4Ghz). Probes, if not included with the counter, can be simple scope probes found new on eBay. There's an IM-4100 on eBay for $36, free shipping.

A simple RF signal generator such as the Heathkit IG-102. I use the VC2000 and a BNC "T" connector with my IG-102. The VC2000 acts as a digital display so I keep the RF signal on frequency. I also have a military AN/URM-25 I use quite often. It's quite stable and produces a

variable RF signal. It also has a built in audio oscillator that can modulate the RF signal. The URM25 is a bit larger and heavier than the IG-102. Simple cables can be made using RG-8x, a BNC male connector on one end and simple probe tips on the other end.

The above is only a small list of some basic and inexpensive test equipment you can buy to learn with. I replaced the screw on connectors on the IG-102 to BNC.

Once you gain experience using basic test equipment then you can graduate to higher quality test equipment.

If I may also make a suggestion on a basic electronic study book. John T. Fryes "Basic Radio Course". You can find the book quite often on Amazon.com, possibly at your local library, on eBay on CD, and possibly at a use book store. I picked up an eBay CD copy and compared it with the hard cover book I found at a used book store. The only difference is the test equipment in the CD version is older than the test equipment in the hard cover copy. The CD copy is older, copyright 1951. The hard cover copy is early 60s. It's an easy to read and learn from book on basic and some advanced electronic theory including vacuum tube theory, amplifier classes, resistance, capacitance, and inductance theory with simple and easy to understand pictoral examples of each type of circuit.

Bob,
I suggest you locate a local "Elmer" to help you. Unless you have proper test equipment, you're just going to be "chasing you tail" trying to troubleshoot your problem.
Find someone with experience working with vacuum tube circuits. Troubleshooting one of these hybrid Kenwood rigs takes some knowledge of electronic theory and at least rudimentary troubleshooting skill. If you have neither, suggest sending rig to a qualified technician.

Be very careful measuring DC voltages in the 820. Like the other KW hybrids, the final amplifier HV alone is "+920VDC" in receive and is present 100% of the time the radio is powered ON. There are other lower DC voltage such as approximately +300VDC on the Rectifier and RF unit boards.

Until you gain some experience, I recommend you make the DC volt meter connections with power turned OFF "FIRST". Check the DC volt meter setting to ensure it's within the DC voltage range you are measuring and ensure there are no shorts in the meter probe connections. If the connections are okay then apply power and read the DC voltage on the volt meter.

If you are measuring DC voltages in transmit, make sure the 820 is connected to a 50 ohm dummy load and key the transmitter using the SEND switch. If any adverse arcing or smoke occurs/heard, unkey the transmitter IMMEDIATELY!!!

As it has been said many times before on this group as well as other ham forums, there are AC and DC voltages inside the 820 or any KW hybrid and other vintage ham transmitters/transceivers, that can easily KILL you if you are NOT practicing safe troubleshooting techniques or failing to pay attention!!. Never measure the RF voltage at the top of the 6146 plate caps and NEVER stick your fingers inside the final amplifier at ANY TIME with power turned ON!!! That RF voltage level can and will destroy an RF probe such as the Heathkit PK-3 and the home made RF Probe I spoke about before. NEVER assume anything, ALWAYS check your connections and other measurements etc to be sure. NEVER assume you will always use safe practices when working around high voltage circuits. There are plenty of hams who "assumed" they were following good safe practices, that are now 6 feet under!!!

Hello all, new ham here, KC3GJX. (Not new to fixing electronics or high voltage stuff, but def new to radio/analog circuits. My first hf rig is a ts-820s, and other than the usual display issue and a vox issue I caused then fixed, seems to work ok. Im taking my time with this studd and trying to learn.

I brought it out to the shop to finally fix the display issues and bought a full cap kit for it as well. Ive recapped the vox board, audio amp board, and the two axial caps (screen?), and doing the larger caps next.

My question is the if board (well the boards where the filters are)...if I dont think I have the proper gear to do an alignment, should I skip capping that board?

I have a bunch of test gear but not sure if I have the right stuff to align it with. I have some signal gens and a nixie based freq counter, and not sure but my Rigol scope may do freq as well.

Will capping affect the alignment?

Thx!

Jeff

What symptom or troubleshooting procedure showed that the capacitors were bad?

Shotgun, wholesale replacement of capacitors (electrolytic or otherwise) is NOT a recommended technique for repairing anything that I know of, old analogue gear or new digital stuff. Ditto replacing all of the semiconductors, or any other parts.

If they ain't broke, don't fix 'em.

If someone told you to replace all the electrolytics because "because," they did you a horrid disservice. Any time you mess with one of these circuit boards, you're risking making something which was working into something which ISN'T and might never again.....

Just replace the bits which your troubleshooting and testing tell you are defective.

> My question is the if board (well the boards where the filters are)...if I
> dont think I have the proper gear to do an alignment, should I skip capping

Unless something shows as "bad" when testing the rig, skip mass-replacement of the capacitors. Or anything else. Get it back together, turn it on, and find out what is actually wrong with it. (IF ANYTHING - these are really robust pieces of equipment, it might just work!!)

These old Kenwoods DO have one real problem, and it isn't the electrolytics.

It's the foil traces on the circuit boards.

Mucking about with them (heating them to remove caps and then re-soldering, for instance) has a severe tendency to lift the foil trace right off the board. Then you're left with replacing the entire stinking board with a scavenged one (Hello, Walter. Likely be doing business with you eventually....), etching your own board, drilling the proper holes, and then re-populating it, or sticking wires on the old, trace-damaged board to make connections where there used to be foil until you burned it off with three seconds too much heat..

I've done all three of those for a TS-520SE. The rectifier board has wires on one section.where a few seconds too long with the soldering iron destroyed the foil traces. The HV board is home-made and hand-etched, and there is a replacement board from Gordon in there, I forget exactly which one.

> I have a bunch of test gear but not sure if I have the right stuff to align
> it with. I have some signal gens and a nixie based freq counter, and not
> sure but my Rigol scope may do freq as well.

Mainly, a signal generator, best if it is one with an attenuator so you can tell how much RF you're feeding in;
a freq counter;
an oscilloscope with RF probes;
and a high-Z input VOM (a VTVM, or a high input-Z FET DMM)

You'll need a dummy load of roughly 300W capacity as well, and this bit is mandatory, so you can tune up and test without radiating a signal. Plenty of those available to buy. Or you can get an empty paint can, some resistors, an SO-239, a few odds and sods of mechanical parts, and some mineral oil, and make one yourself.

A wattmeter is very nice to have,as well. Doesn't have to be one of the gold-plated sort, just something to see if you're actually putting out power.

That is usually enough test gear to be going on with. Other items are very nice to have, but almost all problems can be found and most all adjustments made with only those instruments.

In the archives of this email list, there are numerous discussions of test gear. You should try to dive for them on the list home page. (Despite the "Yahooligans" search functions on their pitiful excuse for a web interface, those posts can, usually, eventually if you're patient and keep trying, be found.)

Oh, and you'll be wanting an RF probe for the VOM / VTVM as well. (High-Z is 10 meg-ohms input impedance, or more. Lots of schematics and instructions on how to home-brew one of those.

Those items were all I used when I was making that 520SE I mentioned work again. (Nobody who has used that machine has gotten a complaint yet, so I must have done something right. I just wish I had more time and could use it once in awhile, myself.....)

Rewound L41 specs

6 turns primary
26 turn secondary
Wound as per directions JPG file in this group.
Wired used. 0.090 mm super enamelled taken from an old inductor.

DC Res measured with regular DMM.

Primary 0.25 ohms approx
Secondary 1.20 Ohms approx

Inductance measured with DIGITAL LCR Bridge
Slug fully flush with case.

Primary 1.00 microhenrys approx
Secondary. 13.5 microhenrys approx

Installed on RF board. Will do RF check today and revert.

Thanks.

Perhaps I have missed it , but I still dont know if you have performed the Driver Stage testing or not?

To do that the panel meter selector switch needs to be in the ALC position and not IP position. Not concerned about setting resting or zero signal plate current for this test. None of the meter scales are involved for peaking the ALC indication. You are tuning input and output LC circuits to resonance and not setting a level.

Go to my website k9tw dot com and look under FAQs on how to test 12BY7A tube without test gear and run that procedure. It explains what you need to get good ALC indication ie RF drive indication.

Some more discussion under the How To tab.

Jeff,
Replacing the electrolytic capacitors on every board simply because the caps are old is very poor troubleshooting techniques. What problem have you found your KW hybrid has and the troubleshooting test results that clearly point to those capacitors on the boards as the source of or are contributing to the problem? Performing a "shot gun" capacitor replacement of all capacitors on the boards can easily lead to creating "new" problems the radio initially never had!! The PC board foil runs and plug pin pads are very sensitive to heat and can easily crack/break by physical force replacing all those capacitors at once. Try locating and fixing many cracked/broken PC board foil runs and cracks/breaks in plug pin foil pads that, after performing "shot gun" capacitor replacement, resulted in your KW hybrid no longer working.

The only electrolytic capacitors that you should consider replacing are the HV and LV supply filter capacitors. As said, unless there are troubleshooting test results that clearly point to a capacitor that is the source or or is contributing to a problem, do not replace the caps using the misleading "shot gun" capacitor replacement method of component replacement.

With exception of the HV and LV supply filter capacitors, replace components ONLY when troubleshooting a problem where the test results clearly indicate a component(s) in question, including capacitors and resistors, is/are the source of or is/are contributing to a problem.

Hi Jeff, I also have a TS-820S refurbished by Terry K9TW. I want to second Wes' comment, these hybrids are like valuable museum pieces. I wouldn't consider "fixing" anything that ain't broke if you know what I mean. All the best

Also some of the screen printing is wrong on boards. As you remove them take note on polarity and install the same way they came out.

Jeff,

Replacing the electrolytic capacitors on every board simply because the caps are old is very poor troubleshooting techniques. What problem have you found your KW hybrid has and the troubleshooting test results that clearly point to those capacitors on the boards as the source of or are contributing to the problem? Performing a "shot gun" capacitor replacement of all capacitors on the boards can easily lead to creating "new" problems the radio initially never had!! The PC board foil runs and plug pin pads are very sensitive to heat and can easily crack/break by physical force replacing all those capacitors at once. Try locating and fixing many cracked/broken PC board foil runs and cracks/breaks in plug pin foil pads that, after performing "shot gun" capacitor replacement, resulted in your KW hybrid no longer working.

The only electrolytic capacitors that you should consider replacing are the HV and LV supply filter capacitors. As said, unless there are troubleshooting test results that clearly point to a capacitor that is the source or or is contributing to a problem, do not replace the caps using the misleading "shot gun" capacitor replacement method of component replacement.

With exception of the HV and LV supply filter capacitors, replace components ONLY when troubleshooting a problem where the test results clearly indicate a component(s) in question, including capacitors and resistors, is/are the source of or is/are contributing to a problem.

Subject: [TS-520_820_530_830] Intro, Ts-820s and re-capping

Hello all, new ham here, KC3GJX. (Not new to fixing electronics or high voltage stuff, but def new to radio/analog circuits. My first hf rig is a ts-820s, and other than the usual display issue and a vox issue I caused then fixed, seems to work ok. Im taking my time with this studd and trying to learn.

I brought it out to the shop to finally fix the display issues and bought a full cap kit for it as well. Ive recapped the vox board, audio amp board, and the two axial caps (screen?), and doing the larger caps next.

My question is the if board (well the boards where the filters are)...if I dont think I have the proper gear to do an alignment, should I skip capping that board?

I have a bunch of test gear but not sure if I have the right stuff to align it with. I have some signal gens and a nixie based freq counter, and not sure but my Rigol scope may do freq as well.

Will capping affect the alignment?

Thx!

Jeff

KM4TAP here. Just received my new (to me) TS-520S. S/N is 560612. I'm a new ham, passed Technician and General a couple of months ago and looking forward to getting a shack together and getting this Kenwood on the air. Still a number of items on the shopping list (microphone, antenna(s), probably a tuner.

Looking forward to talking with you on the group and over the air, and expect a lot of questions from me in the near future.

I have what may be a simple fix, (for some of you). Recently I found a swell 530s, rig was pretty solid except a couple issues, one of which I repaired. Now the other issue is a, what I call, a traveling VFO. Won't exactly settle down. Even after a thorough warm up. Any suggestions?

Have you ever noticed if any of the cap on the IF board in a 530s are marked incorrectly ?

Thats the only board I did a shot gun change on,I did email you directly but had no reply unsure if the mail got to you ?

Paul,

I never received your email.

From memory no. But I cannot say for sure Until I check my diagrams when I get home, which will be in a few weeks. What made you change all the
IF board caps? I have ever changed the hv caps on that board. I have seen bad Molex connector pins and change a small signal tranny. Have chased a few faults with the balanced modulator. I assume your 530 is in the first million series. Haven't seen any really late model ones. Copy and paste my email address from top of this email for direct access or from qrz. com.

Hi All,

Hadn't expected to be posting a question so soon after joining the group!

I've recently acquired an "as new" TS 830S all seems in good order but I've discovered a problem on TX.

There is a loud hum on TX audio when using a Heil Proset Plus that came with the rig.

Changing to a fist mic reduces this to a low background noise, holding the mic cable and the noise increases, touching the mic plug on the rig and the noise goes.

I suspect I have a ground loop of some sort, maybe an issue with the station earth but do not have the same issue on other rigs.

Any comments? Am I on the right track?

Thanks in advance

Craig,
  Inspect the plug wiring. These rigs require that there be no common ground as far as mic wiring goes. The PTT switch is wired to pins 2 & 3, with pin 3 being ground, and the mic element going to pins 1 & 4, with pin 4 being wired to the shield. Look at Pg 6 of the TS-830S Instruction Manual.

Changing to a fist mic reduces this to a low background noise, holding the mic cable and the noise increases, touching the mic plug on the rig and the noise goes.

I suspect I have a ground loop of some sort, maybe an issue with the station earth but do not have the same issue on other rigs.

Any comments? Am I on the right track?

Thanks in advance

Hi Kenwood users;

Has someone experience how to dismantle the microphone cellule of the MC85 desktop mike ?
I could not succeed,are there some screws to remove before ?
I try to connect this MC85 to a old Yaesu FT1000D rig.

But I do have some distortion on the modulation .
I think the fysical contact of the microphone cellule with the earth of the mike boom nick his the reason ?

All suggestions and remarks are welcome related to this problem.

Regards es 73's Jean ON4AEF.

Bob,

If you do not have the Simpson 260 manuals, I have a few of them on my website

http://w5rkl.com/manuals/

Scroll down to the Simpson listing and click on the appropriate manual link. The files are all in pdf format.

I'm glad to hear you are learning from the Basic Radio Course. It's an excellent learning tool.

Craig,

I don't like using non-KW hybrid radios when discussing problem solutions. However, in this case, I experienced the same problem except with my Drake T4XB transmitter and a Shure 444 microphone. The fix was to insert in series with the 444's microphone ground, a .01ufd 25VDC disc cap. This isolated DC wise the microphone element AND the PTT ground, allowing the Shure 444 to use the same PTT ground as the microphone element ground.

If you look at the TS-830 microphone socket wiring you will see this is done in the KW mic socket wiring, a .01ufd disc cap is connected between pins 3 and 4, isolating the PTT ground and microphone element grounds.

If the microphone you are using has only 3 wires, one for PTT DC voltage, one for Microphone element audio, and one for Ground, insert a .01ufd disc cap in series with the microphone's "ground" connection and the PTT ground. This should eliminate the transmit audio hum. This is done on the TS-830 MIC socket if you look at the schematic but you need "4" wires to using the MIC socket.

Jean,

I have been using an MC85 for more than a year now and I get great modulation reports, but I came across the same issues as you have. Unfortunately, while they are a great mike, they are very prone to picking up stray RF.

The most common cure, apparently, is to isolate the Microphone insert from the metal of the gooseneck using thin tape, and thus avoid having a ground loop. The most difficult part is to find out how to remove the insert - I searched and searched but no-one seemed to have any description of how to do this. I eventually discovered by trial and error that the end of the mic (the chromed bit) is actually screwed into the end of the gooseneck with a fine thread - the challenge is to grip the end with something so you can unscrew it! I found a piece of silicone rubber, held tightly against the end will do the trick - give it a try and see how you go.

Having said that, I found that this did improve things a bit but didn't cure the issue. The most effective cure for my issues were to wrap the microphone cords through a clip-on ferrite a couple of times - this really helped a lot. The other method I tried was to put 10nF bypass caps on all the incoming leads of each mic cord - that also helped, but not as much as the ferrites.

The only other bit of advice I would offer is to use the "low-cut" switch - it makes the mike sound much better.

Hope some of this helps your issues.

Cheers, and 73's

Hi Brad,

I take it you mean between the mains earth and my own station earth?

There is a slight potential difference between them, only about 0.5 volts but I reckon there shouldn't be any.

The 830 is the only "mains" powered rig here, the other rigs here are 12 volt so no earth connection to mains, only station earth. Correction, I do have a KW Atlanta (KW as in KW Electronics not Kenwood) it also has a slight hum on receive but it's an old 1960's rig.

A "mains wall socket" tester tells me the sockets are correctly wired and reports a working earth.

Any suggestions on what to do next?

Thanks

My first post I hope I do this correctly.

I am looking at a TS830S for a friend only because I have had two in the past. One of my earlier ones had a similar issue. The technician lifted and replaced some cable connectors and bingo it came to life.
I tried the same thing on this one with no joy. I also used some DeOxit Gold on the band switch still no joy.

I get no LCD readout on 40 or 17 meters all other bands are OK. It does need an alignment. I did inject a 1uv and a 50uv signal OK on 3.5 and 14.0 but no sound from 7.0 with either signal.

Guessing I would say it is something common to both 7.0 and 18.0 MHZ.

Any thoughts out there?

Morning Peter,

Glad to receive some reply from someone about this subject.

The responses are quit poor !!!!

Glad to hear that the microphone cellule is screwd into the gooseneck.

For the moment I do have realize a better earth connection of the PCB with the MC85 metal case

I do had isolated the PCB from the MC85 metal case before,as a try ….

And I do have obtained a better result now the distortion I had before is dissepeared.

And the RF intake into my external SP-5 FT1000D loudspeaker is gone.

My MC 85 is located just behind the SP5 box and the MC85 microphone cable lies under this SP5 box to the MIC connector of the FT1000D

But I do had the impression from times and days before,that it somethimes comes back again for what reason I don’t now ??
Momentarly its all gone,hope it stays away now for ever !!!

I do not use any kind of high power….

I do not have any amplifiers in use so the high power could not be the big destroyer hi hi.

I am already more than 30 years a barefoot operator

But thanks anyway,that I now,how I have to remove the microphone cellule,if I like to do so in future Peter.

Most reflector remarks and users have made the same remark about this microphone isolation.

But like you told it is not the general most important issue of bad modulation and having some distortion and so on !!!

And I do believe you.

What I do not understood that Kenwood sell a desktop microphone unit that does not work in his standardly configuration ??
I presume connecting this unit to a Kenwood rig in place of a Yaesu rig does occure the same problems !!!!!!!!!!!!!!!

I will try to make some qso’s will the switch in the “low cut configuration”,see what result will be.

Does you have changed some components inside the unit Peter (capacitor and resistors of some filters) ??

I supply my MC85 externally with a power supply (+8VDC) arranged from my FT1000D on pin 5 of my microphone frontpanel connector.

So I do not have to spent a lot of battterys hi hi..

Best regards and thanks again for your replay and help

73’s Jean ON4AEF.

Bill:

Do you have a means of measuring RF voltage (RF Millivolt Meter, O-scope, or RF probe and VTVM/DMM)?

If so, go to RF board and measure the VCO signal level at TP-3 for the two bands in question. Need 1.0 rms RF volts.

If missing perform SM step 9. Anything below about 1vdc on the VCO Vari-cap line will blank the display.

Looking down on the RF board will see 7 red/brown vertical bandswitch wafers. The one closest to the front panel is S1-1 and is the diode matrix switch that feeds the digital display counter unit board. Clean the contacts.

If VCO signal is missing injecting test RF into SO-239 on those bands will not produce any "sound" because the VCO is not only needed for digital display it is also the LO for the Q3/Q4 RIF Mixer.

Hi,
I have had my TS530sp for a couple of months now and enjoy using it on CW QRP.
Tuning a valved (Tube) rig is new to me . My tuning procedure is to tune the Drive- Plate - leave the load CCW.
Adjust my power output (5 Watts) using the CAR control.I.e I read off the output on the meter on my ATU.
Initial tuning is into a dummy load.
Is this OK or should I at least do some adjustment of the Load control?
I did start to make the 9v remote control box that plugs into the "Remote" socket but realised I did not need it for CW!

many thanks,
Richard G0ILN.

Some of the experts say not resetting the loading capacitor is introducing a mismatch to the final tubes, but reducing the drive level with the carrier control reduces the plate current and I don't think at that power level you will do any harm. I ran QRP with my TS520 (no S) for many QSOs the way you indicate your tuning. I could get down to about 750 mW output and worked many QSOs 500 miles on 40M.My 520 was my main radio for about 40 years and I retired it for a TS440s and then a FT990. Topic: 54929 Message: 54931

The LOAD control is adjusted during the final steps of transmitter tuning for maximum "REL PWR" or "external watt meter" indication. The LOAD control provides as close of an impedance match as possible with the impedance load provided by the antenna. The LOAD control should never be used to lower power output after the transmitter tuning process has been completed.

When the transmitter tuning process has been completed properly and the mode of operation is CW, it is perfectly acceptable to lower power output by rotating the CAR control. The CAR control is only used in TUNE and CW modes. The CAR control is disabled in SSB modes. The CAR control cannot be used to "preset" a power output level for side band operation during transmitter tuning.

Calculating DC power input and power output does not require a watt meter. The REL PWR meter switch position is not a watt meter and that switch position does not have a scale. The REL PWR meter switch position only provides "Relative Power Output" indication ONLY. The REL PWR meter switch position is nothing more than a diode to rectify the RF output, a bypass cap, a couple of fixed resistor forming a resistor voltage divider, and a pot to very the DC voltage produced by rectifying the RF into a DC voltage. The DC voltage is then applied to the meter to indicate the "Relative" RF output, nothing more.

Having said that, simply tune the transmitter in TUNE and CW modes as outlined in the operating manual then set the meter switch to IP and with the transmitter keyed in CW mode, note the IP meter indication. Keeping the transmitter keyed, switch the meter to HV and note the HV indication. Multiply the HV by the IP meter indications will provide the approximate final amplifier's DC input power. For example, let's assume the IP meter indicates 225ma and the HV indicates 800VDC in CW mode with the transmitter keyed after transmitter tuning has completed. Using the formula

Pin = HV x IP

and the HV and IP meter indication values above, the DC input power will be approximately 180 watts

800 x .225 = 180 watts

The final amplifier in the KW hybrids operates in Class AB1 which has an approximate efficiency percentage of input to output power of 60%. Therefore, subtract 40% from 180 watts input and you will see approximately 108 watts output (180 - 40% = 108) at the antenna connector (SO-239) into a 50 ohm load. PEP power cannot be determined using the IP and HV meter indications since the RF levels changes very

rapidly and the HV and IP meters cannot keep up with the rapid changes.
A PEAK READING watt meter is required to see the approximate PEP output.

Most hams, not all, have/use "relative power" watt meters. Tuning the transmitter properly as outlined in the manual and adjusting the MIC gain for an ALC meter indication that varies within but not above the ALC scale on side band voice peaks, will indicate an approximate power between 20 and 30 watts on the watt meter. This is "Normal" and should NOT be considered a problem with your transmitter!!

The Astatic 10DA has an impedance of 40K ohms. It should work with all the KW hybrids. I doubt a difference of 10K ohms will make any difference in the transmit audio when used with all 4 of the KW hybrids. The TS-530 and TS-830 have a microphone impedance range from 500 ohms to 50K ohms. The TS-520 and TS-820 have an impedance of 50K ohms. The microphone impedance specifications are listed in all of the KW hybrid user manuals, available on my website http://www.w5rkl.com/ then click on the "Manual and Document" link. When the page comes up, click on the appropriate KW hybrid user manual link.
The 10DA microphone specifications can be found using the following link. When the file downloads and opens Adobe pdf read, scroll through the document and you will find the 10DA microphone picture and specifications.

https://www.google.com/search?q=+Astatic+10DA-L&ie=utf-8&oe=utf-8

If you experience hum in the transmit audio when using the 10DA microphone with your KW hybrid, insert a .01ufd 25VDC disc cap in "series" with the microphone element's Ground AND the PTT ground. This will allow you to use the PTT ground AND microphone element ground together which will DC isolate the microphone ground from the PTT ground, eliminating the transmit hum. This is how Kenwood DC isolates the microphone element and PTT grounds in the Kenwood 4 wire microphone cable/plugs (see the KW hybrid MIC socket wiring in the KW hybrid manuals for details).

The T-UG8 microphone base has the solid state amplifier. You can keep and use the amp if you want but I recommend you bypass the amp and rewire the base to use it with your KW hybrid(s).

The base wiring is found pasted to the round plate on the bottom of the base. Remove the 3 screws and turn the round plate over.

If the schematic is torn and missing portions, you can download the T-UG8 schematic at the following link:

https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=3&ved=0ahUKEwj_5aDKhqvNAhVDLSYKHaVuB3cQFggnMAI&url=http%3A%2F%2Fwww.rollanet.org%2F~rrars%2Ftech_files%2Fd104_manual.pdf&usg=AFQjCNFrA92eAq_H8OW4x7OkD1ecflm1yg&cad=rja https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=3&ved=0ahUKEwj_5aDKhqvNAhVDLSYKHaVuB3cQFggnMAI&url=http%3A%2F%2Fwww.rollanet.org%2F~rrars%2Ftech_files%2Fd104_manual.pdf&usg=AFQjCNFrA92eAq_H8OW4x7OkD1ecflm1yg&cad=rja

Ignore the 4.7K resistor and .01ufd capacitor to ground hand written additions.

I use the T-UG8 base with my Heathkit Apache TX1 and it works very well. I simply didn't bypass the amp I removed the amp altogether. I then rewired the microphone PTT wiring in the base to accommodate PTT for my Apache TX1, HW-101, and SB-100 transmitters and transceivers.

I had a set of twins and a TS-530s back in the 80's. In the intervening years I got spoiled by no-tune rigs and had forgotten how much fun these old analog rigs were.

Well, I got my TS-520 last Friday (pics already up in the Photos section) and have been having a ball. I made 35 or 30 CW QSOs and checked into SoCARS a couple of times. Boy, is this ever fun!

I was surprised that I was able to throttle it all the way down below 5 watts with the CAR control. I hope that's not bad for the tubes. It loads up to 200 MA IP which yields 100 watts out, according to my auto-tuner. The CAR control is advanced to just under "2" for 100 watts out. The HV measures just a hair under 800v, key down.

Truth be told, the narrow DSP filters and NR in my TS-570D(G) pull really,really weak signals in better than the TS-520 - solid copy vs. guessing-some copy. But I'd much rather listen to CW and SSB on the TS-520 - much more pleasant.

Wouldn't mind trading the 570 for a set of 599A Twins.

I missed the Hybrids net last Saturday, but plan to check in this week.

Great to be back.

This rig need some help with the filtering. But that solution is pretty easy if you can build up a kit. Check out the NM0S Hi-Per Mite CW filter (analog) and cumbria MiniFilter (DSP) for some low cost, high performance options.

This is what I built to run with my hybrids, if you are interested in that sort of thing:

Has anyone tried the InRad #101 CW filter in their TS-520?

Their #101 is listed for TS-511, TS-520, TS-520s, and R-599. Speced as a 400 Hz 8-pole with shape factor of 2.7 (as opposed to 500 Hz, shape factor 3.0 for the YG 3395C).

I wonder if it yields $130 worth of improvement.

I know R.L. Drake is not Kenwood but since I have experience with the KW #101 400Hz CW filter and the Drake 2603.2 500Hz CW filter, I can say they both have the same basic specs. Neither of the filters ring.

I must say the square body of the INRAD #101 TS-520 500Hz CW filter is "physically" larger than the original KW CW filter. Therefore, the INRAD filter will not rest exactly flush on the board as the original KW CW filter does. Pay attention and do not press down firmly on the filter as you can damage the diode select and/or other components lead plus cause a short by the filter's square metal body. I found that out when I was fixing a friends INRAD #101 filter he tried installing in his TS-520S. He pressed down hard on the filter and the end broke the diode select diode lead. I was able to fix the broken lead and get the filter to work.

If the inrad gives the same performance as the original kenwood filter, yes it make quite a bit of difference. I operate the 520 pretty extensively on cw and the difference is night and day. There is a mod that allows you to cut the filter in and out of the circuit, I highly recommend the mod.

Brian,

It appears you misread/misunderstood what I said. I did not say the INRAD Kenwood #101 400Hz CW filter had the same specifications and performance as the ORIG Kenwood CW filter.

What I said was I had experience with the INRAD Kenwood #101 400Hz CW filter and the INRAD Drake 2306.2 500Hz CW filter. I said both INRAD filters for Kenwood and Drake had the same basic specifications. I also stated that both CW filters did not ring. A difference of 100Hz will not make a difference in either CW filters.

The mod you are referring to adds a SPDT switch to the rear panel and wiring the switch to select either CW or SSB filters. This change was later incorporated in the TS-520SE by changing the TS-520 and TS-520S HEATER switch to allow the operator to select between SSB or CW filter in CW mode, assuming the CW filter is installed on the IF Unit board. The change rewired the driver and both filament wiring so the filaments of all 3 tubes were lit as long as the main power switch was set to ON.

The SSB/CW filter select mod/change found on the web also suggests an alternate method which rewires the FIX CH crystal select switch positions 3 and 4 to control the SSB or CW filter selection. I don't recommend that. I recommend adding the mini SPDT toggle switch on the rear panel, labeling it WIDE/NAR instead. Any mods/changes one performs on their ham gear should be noted in the radio's user and/or service manual and the user/service manual should accompany the radio.

The Astatic 10DA has an impedance of 40K ohms. It should work with all the KW hybrids. I doubt a difference of 10K ohms will make any difference in the transmit audio when used with all 4 of the KW hybrids. The TS-530 and TS-830 have a microphone impedance range from 500 ohms to 50K ohms. The TS-520 and TS-820 have an impedance of 50K ohms. The microphone impedance specifications are listed in all of the KW hybrid user manuals, available on my website http://www.w5rkl.com/ then click on the "Manual and Document" link. When the page comes up, click on the appropriate KW hybrid user manual link.
The 10DA microphone specifications can be found using the following link. When the file downloads and opens Adobe pdf read, scroll through the document and you will find the 10DA microphone picture and specifications.

https://www.google.com/search?q=+Astatic+10DA-L&ie=utf-8&oe=utf-8

If you experience hum in the transmit audio when using the 10DA microphone with your KW hybrid, insert a .01ufd 25VDC disc cap in "series" with the microphone element's Ground AND the PTT ground. This will allow you to use the PTT ground AND microphone element ground together which will DC isolate the microphone ground from the PTT ground, eliminating the transmit hum. This is how Kenwood DC isolates the microphone element and PTT grounds in the Kenwood 4 wire microphone cable/plugs (see the KW hybrid MIC socket wiring in the KW hybrid manuals for details).

  The Astatic 10DA has an impedance of 40K ohms. It should work with all the KW hybrids. I doubt a difference of 10K ohms will make any difference in the transmit audio when used with all 4 of the KW hybrids. The TS-530 and TS-830 have a microphone impedance range from 500 ohms to 50K ohms. The TS-520 and TS-820 have an impedance of 50K ohms. The microphone impedance specifications are listed in all of the KW hybrid user manuals, available on my website http://www.w5rkl.com/ then click on the "Manual and Document" link. When the page comes up, click on the appropriate KW hybrid user manual link.
The 10DA microphone specifications can be found using the following link. When the file downloads and opens Adobe pdf read, scroll through the document and you will find the 10DA microphone picture and specifications.

https://www.google.com/search?q=+Astatic+10DA-L&ie=utf-8&oe=utf-8

If you experience hum in the transmit audio when using the 10DA microphone with your KW hybrid, insert a .01ufd 25VDC disc cap in "series" with the microphone element's Ground AND the PTT ground. This will allow you to use the PTT ground AND microphone element ground together which will DC isolate the microphone ground from the PTT ground, eliminating the transmit hum. This is how Kenwood DC isolates the microphone element and PTT grounds in the

Kenwood 4 wire microphone cable/plugs (see the KW hybrid MIC socket wiring in the KW hybrid manuals for details).

No, I am not mad at you for using a Turner 454X desk microphone.

I suspect your distorted transmit audio is NOT caused by RF but rather caused by "sharing" the PTT ground on pin 3 with the microphone element's Ground return, should never be done that way!!!

I suspect you have the 4 pin microphone plug wired as follows:

Pin 1 - One side of the PTT switch
Pin 2 - Microphone element's Positive terminal
Pin 3 - PTT Ground which is shared for both pins 1 and 2 (Bad JU-JU!!!)
Pin 4 - Not used

If this is how your 454X is wired then you need to do the following.

1. Carefully open the bottom of the microphone base
2. Note the 2 wires routed up through the neck of the microphone base and where they connect to the PTT switch. One wire from the neck will be connected to ground at the PTT switch. I'll call this wire "MC#1".
3. Disconnect the "MC#1" wire at the PTT switch but remember where it was connected.
4. Connect a .01ufd 25VDC disc or polyester capacitor, but NOT an electrolytic capacitor, between MC#1 wire and the place MC#1 wire was connected to the PTT switch.
5. Solder both connections.
6. Check for shorts and put the cover back on.

Test the microphone with your TS-830. Your transmit audio should now be clean, no distortion.

I use a Turner "Johnson" desk microphone I picked up at a hamfest for $10 with my Drake T4XB transmitter and I had to do the above cap addition to solve distorted transmit audio, same as what you are experiencing. It's very easy to do.

Willard,

You need to give us something to work with.

Mike asked about the connections to the mic plug.
Have you opened you mike and checked the connections?

Have you done any other investigation besides the observations you've given us?

This is a really good reference for those that
work with different microphones. It may help you
with your mic wiring if that's indeed the
problem. http://www.qsl.net/g4wpw/date.html

G'Day Geoff,

Yep it's a beaut. There's not many
radios/microphones that aren't listed and in most
cases even if you can't find the exact
radio/microphone combo there are others that are compatible.

Regards

Lou

Here's the response I sent to Willard, containing the simple steps to eliminate the TS-830 distorted transmit audio. I didn't select "Reply All" when I replied to Willard's comments and pictures.

Also, Willard, you need to add an acceptable message signature to the end of all messages you post on this group. If you are not sure what an acceptable message signature is then I recommend you download the group's policies that can be found on my website using the following link:

Subject: Re: [TS-520_820_530_830] Microphone Compatibility Question
Date: Sun, 19 Jun 2016 08:03:50 -0500
From: Mike W5RKL <w5rkl@...>
To: Willard Young <vintgam@...>

As I said before in my previous response and if you look at the 2 wires coming from the "NECK" of the microphone, the wires are colored "GREEN" and "BLACK". The GREEN wire connects to the microphone element's "Positive" terminal and the BLACK wire connects to the microphone element's "Ground" terminal.

The microphone element's "BLACK" wire coming from the NECK of the microphone is connected to the shield at a terminal on the top of the PTT switch. The SHIELD in your microphone is used as PTT ground and most likely is connected to pin "3" on the microphone plug. The TS-830 microphone socket pin 3 connects directly to the 830 chassis ground as seen on the 830 schematic. "Sharing" the microphone element's BLACK ground wire AND the PTT chassis ground on pin 3 of the microphone socket is what's causing your distortion. The BLACK wire from the microphone's Neck must be disconnected at terminal on top of the PTT switch. You will notice the shield is also connected to that terminal.

Perform the following steps.

1. Disconnect the "BLACK" wire coming from the neck of the microphone where it connects to the terminal on top of the PTT switch. The microphone cable Shield also connects to this terminal.

2. Strip about 1/2" of insulation off the Neck's "BLACK" wire.

3. Slide a piece of Heat Shrink tubing over the Neck's BLACK wire then connect and solder one lead of a .01ufd 25VDC disc capacitor to the Neck's "BLACK" wire.

4. Slide the Heat Shrink tubing over the capacitor lead's bare wire AND the Neck's BLACK wire connection. Heat the tubing so it shrinks around the wire and capacitor lead connections and cap's bare lead.

5. Connect and solder the other lead of the .01ufd 25VDC disc capacitor to the terminal on the PTT switch where the SHIELD is connected to. This lead of the capacitor should be short, just enough to make a solid connection to the terminal on top of the PTT switch where the Shield connects to.

Check to ensure there are no wires shorting together.

Plug the microphone plug into the TS-830 and test the microphone. Your transmit audio should be clean, no distortion.

Put the bottom plate back onto the microphone and secure it with the 4 screws, you're done.

I have the same Turner microphone but without the ELEC/RELAY switch. I used the above procedure and a .01ufd 25VDC disc capacitor to eliminate distortion in my transmit audio. The capacitor, as I stated before, "DC Isolates" the microphone ground return from the actual PTT ground on pin 3. The Kenwood microphones have the proper wiring. Many non-Kenwood microphone do not have the correct wiring so a cap is required in the microphone element's ground return wire to DC isolate the microphone from the PTT ground on pin 3.

The microphone's ELEC/RELAY switch must be set to and left at the "RELAY" position.

Mike and group, Thanks so much for your expertise and patience! I knew full well about the signature, but.... I can't believe how much of your valuable time you spend helping other hams. The 454 crystal mic really gives me sharp clear audio that I need to punch through the jerks who jam the WARFA net with foul language and disgusting recordings, and illegal power.

Tnx&73, Will KJ6JKA

As I said before in my previous response and if you look at the 2 wires coming from the "NECK" of the microphone, the wires are colored "GREEN" and "BLACK". The GREEN wire connects to the microphone element's "Positive" terminal and the BLACK wire connects to the microphone element's "Ground" terminal.

The microphone element's "BLACK" wire coming from the NECK of the microphone is connected to the shield at a terminal on the top of the PTT switch. The SHIELD in your microphone is used as PTT ground and most likely is connected to pin "3" on the microphone plug. The TS-830 microphone socket pin 3 connects directly to the 830 chassis ground as seen on the 830 schematic. "Sharing" the microphone element's BLACK ground wire AND the PTT chassis ground on pin 3 of the microphone socket is what's causing your distortion. The BLACK wire from the microphone's Neck must be disconnected at terminal on top of the PTT switch. You will notice the shield is also connected to that terminal.

Perform the following steps.

1. Disconnect the "BLACK" wire coming from the neck of the microphone where it connects to the terminal on top of the PTT switch. The microphone cable Shield also connects to this terminal.

2. Strip about 1/2" of insulation off the Neck's "BLACK" wire.

3. Slide a piece of Heat Shrink tubing over the Neck's BLACK wire then connect and solder one lead of a .01ufd 25VDC disc capacitor to the Neck's "BLACK" wire.

4. Slide the Heat Shrink tubing over the capacitor lead's bare wire AND the Neck's BLACK wire connection. Heat the tubing so it shrinks around the wire and capacitor lead connections and cap's bare lead.

5. Connect and solder the other lead of the .01ufd 25VDC disc capacitor to the terminal on the PTT switch where the SHIELD is connected to. This lead of the capacitor should be short, just enough to make a solid connection to the terminal on top of the PTT switch where the Shield connects to.

Check to ensure there are no wires shorting together.

Plug the microphone plug into the TS-830 and test the microphone. Your transmit audio should be clean, no distortion.

Put the bottom plate back onto the microphone and secure it with the 4 screws, you're done.

I have the same Turner microphone but without the ELEC/RELAY switch. I used the above procedure and a .01ufd 25VDC disc capacitor to eliminate distortion in my transmit audio. The capacitor, as I stated before, "DC Isolates" the microphone ground return from the actual PTT ground on pin 3. The Kenwood microphones have the proper wiring. Many non-Kenwood microphone do not have the correct wiring so a cap is required in the microphone element's ground return wire to DC isolate the microphone from the PTT ground on pin 3.

The microphone's ELEC/RELAY switch must be set to and left at the "RELAY" position.

OK, I opened up the 454x. It also has a switch on the bottom for relay or electronic switching. Have a feeling that is trouble. Sending some pics.

On Saturday, June 18, 2016 10:51 AM, Mike W5RKL <w5rkl@...> wrote:

No, I am not mad at you for using a Turner 454X desk microphone.

I suspect your distorted transmit audio is NOT caused by RF but rather caused by "sharing" the PTT ground on pin 3 with the microphone element's Ground return, should never be done that way!!!

I suspect you have the 4 pin microphone plug wired as follows:

Pin 1 - One side of the PTT switch
Pin 2 - Microphone element's Positive terminal
Pin 3 - PTT Ground which is shared for both pins 1 and 2 (Bad JU-JU!!!)
Pin 4 - Not used

If this is how your 454X is wired then you need to do the following.

1. Carefully open the bottom of the microphone base
2. Note the 2 wires routed up through the neck of the microphone base and where they connect to the PTT switch. One wire from the neck will be connected to ground at the PTT switch. I'll call this wire "MC#1".
3. Disconnect the "MC#1" wire at the PTT switch but remember where it was connected.
4. Connect a .01ufd 25VDC disc or polyester capacitor, but NOT an electrolytic capacitor, between MC#1 wire and the place MC#1 wire was connected to the PTT switch.
5. Solder both connections.
6. Check for shorts and put the cover back on.

Test the microphone with your TS-830. Your transmit audio should now be clean, no distortion.

I use a Turner "Johnson" desk microphone I picked up at a hamfest for $10 with my Drake T4XB transmitter and I had to do the above cap addition to solve distorted transmit audio, same as what you are experiencing. It's very easy to do.

On Wednesday, June 15, 2016 3:10 PM, "W5RKL w5rkl@...[TS-520_820_530_830]" <TS-520_820_530_830@yahoogroups.com> wrote:

The Astatic 10DA has an impedance of 40K ohms. It should work with all the KW hybrids. I doubt a difference of 10K ohms will make any difference in the transmit audio when used with all 4 of the KW hybrids. The TS-530 and TS-830 have a microphone impedance range from 500 ohms to 50K ohms. The TS-520 and TS-820 have an impedance of 50K ohms. The microphone impedance specifications are listed in all of the KW hybrid user manuals, available on my website http://www.w5rkl.com/ then click on the "Manual and Document" link. When the page comes up, click on the appropriate KW hybrid user manual link.
The 10DA microphone specifications can be found using the following link. When the file downloads and opens Adobe pdf read, scroll through the document and you will find the 10DA microphone picture and specifications.

https://www.google.com/search?q=+Astatic+10DA-L&ie=utf-8&oe=utf-8

If you experience hum in the transmit audio when using the 10DA microphone with your KW hybrid, insert a .01ufd 25VDC disc cap in "series" with the microphone element's Ground AND the PTT ground. This will allow you to use the PTT ground AND microphone element ground together which will DC isolate the microphone ground from the PTT ground, eliminating the transmit hum. This is how Kenwood DC isolates the microphone element and PTT grounds in the Kenwood 4 wire microphone cable/plugs (see the KW hybrid MIC socket wiring in the KW hybrid manuals for details).

54954. Hybrid Net Update (June 19, 2016)

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-06-19 19:46:59 UTC
From: Mark Gilger
Topic: 54954 Message: 54954

There will be no net next weekend due to Field
Day. See everyone the first weekend in July.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started its existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Saturday net was run by Mark, WB0IQK. There
were 7 stations checking in under poor
conditions. There were no new check-ins today.

We had the following number of radios checking in.

1 running TS-520(x)
2 running TS-530(x)
1 running TS-820(x)
1 running TS-830S
0 running TS-510
0 running TS-511
0 running TS-515
0 running 599 twins
0 running TS-900

I was running my TS-830s and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
17 stations checking in under very poor band
conditions. There were 5 new stations checking
in: KG5IPR, W0ALS, KG5MPI, WB0OAF, and N0CRM.

We had the following number of radios checking in.

3 running TS-520(x)
0 running TS-530(x)
4 running TS-820(x)
1 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and TS-940s,
which of course is not a hybrid, although over
30+ years old. Everyone is welcome as long as
they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 ☐ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins
November 2015, Saturday net total = 66, Sunday total = 46
December 2015, Saturday net total = 55, Sunday total = 73
January 2016, Saturday net total = 129, Sunday total = 81
February 2016, Saturday net total = 98, Sunday total = 72
March 2016, Saturday net total = 74, Sunday total = 35
April 2016, Saturday net total = 101, Sunday total = 57
May 2016, Saturday net total = 51, Sunday total = 32
June 2016, Saturday net total = 30, Sunday total = 36 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Will,

I'm glad to hear your 454X microphone is now working well for you.

54956. Ts-820s One dead band.

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-06-21 21:33:26 UTC
From: bigmartinrodgers@...
Topic: 54956 Message: 54956

Hi All,

I have a 820s with one dead band 28.5mhz, no digital readout, no Rx. All other bands are ok. I have read through this forum and got lots of useful info for which I was very grateful. I have narrowed the fault down to the vco (x50-1330-00) board. I found that Q8 fet (2sk19) was faulty. symptoms were that I had no VCO output on the faulty band only. All other bands were ok.

Would anyone know where i could get a replacement 2sk19. I would like to replace it with the same type. The original toshiba type with the metal case, i think its a TO-92.
I would welcome any suggestions.

best regards

73's

Terry

Looks like I have had my share of bad luck. I rewound L41, tested it on bench for voltage step up and it tested OK. But after I put it on board something went wrong an no signal again. I guess some winding must have shorted inside.

I will have to rewind the L41. But parallelly I would also like to wind a Binocular core transformer, just in case. And if the Balun thing works OK, will replace it for two good reasons. A) Not much interested in 160 and B) This Balun will be on BN-61-202 core and No 28 wire. Will be immune against RF and ESD attacks.

I was designing it around Amidon Balun core. The Input reactance has to be four times the impedance thus 50X4 = 200 Ohms and for that kind of reactance the Inductance should be 22 Microhenrys and not 0.85 MicroH. And turns ratio should be 1:4.

Anyone here who has used a Toroidal or Balun Xfmr in place of L41 ?

Thanks

Rahul
VU2YK

---In TS-520_820_530_830@yahoogroups.com, <wagstw46@...> wrote :

Yes it is not an easy task.

For me it takes a lighted magnifier head set and no coffee! I have broken the hair wire more than once!

I have the AADE IIB and a BK875 digital LCR bridge. I have seen some pretty low price Chinese units on Ebay. Some that measure inductance, capacitance, ESR, and test transistors for around $30.00.

Another way to test is with known capacitor and grid dip meter.

Is the board on the bench and you are injecting test signal at Molex Conn 3 Pin 3 Ant and measuring at VC-1 "S" solder lug?

Must have the band switch shaft installed and wafers properly aligned. Set VC-1, VC-2, VC-3 to half mesh. Inject 1.9mhz at 50mv . Set BS knob to around 0700 (may have to rock it either side to find the the contact). Should see approx 260mv output.

That is proper way to test the entire RF signal path. Should be no way to short or open L41 winding turns with RF sig gen. Multiple unsolder and resolder risks lifting a pad or trace.

Terry K9TW

Topic: 54852 Message: 54960

I forgot to mention dont limit your test to 1.9mhz.

Check thru the normal bandswitch progression ie 3.750, 7.150, 10.125, 14.175 thru 28.800.

Also, nothing magical about using 50mv or -13dBm. I only suggested that level as many folks would be limited to test gear that would employ a signal diode RF probe and VTVM/DMM and which would allow them to be able to see and measure 250mv.

You can use 5mv (-33dBm) and should see approx 30mv if you have capability of measuring lower RF voltages.

Terry K9TW

54961. Need display part, crystals for TS-820S

Yahoo group: TS-520_820_530_830 (2015 — 2016)

Topic: 54961 Message: 54961

Greetings all,

I'm in need of a display PCB/leads-connector/bracket for one of my hybrids. This is the early type which used an LD-8109 display tube (all wires at one end of PCB) instead of the later LD-8135 which has leads at either end of the tube envelope.

If you have an early board with a defective VFD tube, great. I'll also take a working version of either board with a fully functional -8135 tube, or an -8135 by itself. Anything to brighten up one of my rig's readouts!

Additionally, if any list member has ever un-converted an '820 from a life spent on the CB band and has the leftover PLL Board crystals (in particular, 32.500 and 33.000MHz) I would like to buy them from you for an R-820 conversion project.

Replies off-group, please.

Thanks - 73

Fred, N8YX

Fred,

I don't have the PCB and other leads and connectors you are looking. You might try Walter Dilley

walter.dilley@...

He has a lot of KW hybrid spare parts.

As for the PLL crystals you need I recommend you contact International Crystals in Oklahoma City, OK

https://www.icmfg.com/hamradio-manufacturers.html

I recently purchased a pair of RX (33.3Mhz) and TX (29Mhz) crystals that I'm using to move an old 11 meter Johnson Messenger III up to 10 meter AM on 29Mhz. When I placed the order they told me it would 3 weeks. Had the crystals in hand in 1 week.

Typical individual crystal prices for 5Mhz and above is $25. Yes the prices have gone up but the quality is excellent. I purchase all my crystals from them and have never received a bad crystal yet. Notice the link above lists "Kenwood" as one of the many manufacturers they provide crystals for.

Hello Fred,

(And thank you Mike, for the intro). Yes, I have an inventory of parts from donor rigs to help the do-it-yourself (DIY) ham fix his hybrid.
I do have the crystals you are looking for (not for someone to convert a TS-820 to CB) but as parts salvaged from restoring PD boards.
It also sounds like you are in need of a display tube?

Please contact me off-list.

Thanks,
Walter, kd7dny

Can anyone tell me what would be causing my 530S to blow the 6v fuse in the back? I was switching from ip to RF on the meter switch, and I heard a short buzz and then the fuse blew.

Thanks
Richard

Richard,

The 6 amp fuse will blow when you draw excessive current. This could be when going through tuning process you take too long when you have excessively mismatched pi network, excessively high swr causing high current draw.
You have gaseous 6146b tube and suffer a flash over. The 4x20 ohm resistors on final board should be checked, should read 5 ohms. These are old carbon resistors and do go out of spec as an example.
If any repairs were carried out prior to blowing fuse? A wire may have been pinched under mounting screw etc.
These are examples which may cause fuse to blow

Hi Richard,

You may be fully aware, but please be very careful doing any work inside that radio. There are voltages in there that can kill you. There are some very knowledgeable folks on here that I'm sure will be glad to help, but the first thing is to stay safe.

Good Luck,
Kevin - N2FLP

Good morning,

There's an email floating around that, at first glance, "appears" to have come from me. Trust me, I did not send that email.

The email text may say "Good afternoon" and your name, your name quite possibly taken from your email address.

If you look closely at the address used you will notice the email service provider's address is:

"_/ig.com.br/_"

That service provider address, "ig.com.br", is in "Brazil".

The email text may have a link in the text. Do NOT click on the link, instead delete the email.

My 830 display and receive has failed on all bands except for 14MHZ. The radio was left on for about 12hrs ,when I entered the shack I noticed the display was blank and the receiver was deaf with static. The TX appears to be fine, I have checked most of the circuit board connectors and screws, the filter capacitors may be showing signs of wear. I noticed the VCO plug was floating and I was not sure if I had accidently pulled it off when I was checking the plugs, the wafers and band switching all appear to be in good condition, Has anyone got any suggestions as to what may be the cause of the problem?

Kind Regards,

Russell Norton VK4BEG,

If I might add another bit of advice...
Be very cautious inside your rig. First and foremost, remove the power plug from the mains source....then, go make a fresh pot of coffee and have a cup or two BEFORE going into the radio. That should give time enough to allow high voltage to bleed off to "safe" levels.
If you are working inside tube radios, you should also keep one hand in your back pocket while poking your meter leads inside. Keep the voltage outside your body, not through you.

DO remove the mains plug from the outlet before getting into the rig. You will eventually be putting it back in to power things up, but that will be later, when you have made sure there is nothing shorted to the bench or a piece of the cover propped across a circuit board. (I almost powered up with the cover plate for the adjustment panel inside the chassis, near the HV voltage doubler circuit board.... Lucky me, I check habitually and thoroughly.)

And you might want to back off on the caffeine when getting into a rig. Make that de-caff coffee, perhaps. Caffeine tends to make your hands shake a little....

Time might not make the difference to the capacitors, if there is no good path for them to discharge across. Use a "Chicken-Stick" instead, and be certain. I suspect somebody has made a "video" of one somewhere on the internet, if that's up your alley. But these little life-savers have been covered a lot of times in the archives of this mailing list, but essentially it's an alligatort' clip a hunk of heavy-ish wire, and a resistor. (20K ohms, whatever you have over 2K ohms, and maybe 5W size. Over 300V or so, I use the 5W 20K square-bodied power resistors.) Clip, wire, resistor, that's it. Mount the resistor on a piece of dry wood doweling or a non-conductive chunk of stiff plastic rod or the like (NOTE THE NON-CONDUCTIVE PART!) with one lead hanging out like a meter probe (the other end gets the wire to the alligator clip of course) to make it easier to handle.

Clip the 'gator to the metal chassis, and then touch/hold the resistor lead on the other end of the wire to the capacitor positive lead. Wait for a count of ten or so, then check the cap for voltage before handling it ANYWAY.

> If you are working inside tube
> radios, you should also keep one hand in your back pocket while poking your
> meter leads inside. Keep the voltage outside your body, not through you.
> John/N7IQ

The 'one hand in your pocket' rule does work, sort of, but it also makes it pretty difficult to keep your balance and get any work done. The idea is to

not give the equipment under test a discharge path across your chest cavity (where your heart is....). If putting your hand in your pocket is not good for you, then cultivate a habit of keeping one hand on the table, or anywhere away from the guts of what you are working on, whenever possible.

Another, often better, method of making high-voltage measurements is to

1) shut down, un-plug, and bleed off the capacitors (chicken-stick, but do a voltage check after bleeding them down ANYWAY!);

2) put the meter probes on the points to be measured, and connect them to the meter/scope/whatever;

3) plug in, make the correct front-panel settings (freq. band, carrier pot, load control, dummy load, etc.), power up, take the reading.

4) POWER OFF, UN-PLUG, DISCHARGE AGAIN, and THEN remove the probes. Folks seem to forget this part for some reason, and just reach in and grab the clips. ZAP. Ouch. If you're lucky, it's just ouch and not a casket.

Work on these sorts of critters awhile and this kind of thing gets to be second nature. It's kind of a pain to learn the habits but it is a lot less of a pain than getting nailed by a live circuit you thought was 'dead.'

(Been doing this stuff since before high school and I learned these lessons the hard way. You don't have to. I could spit sparks for awhile there, and I can tell you precisely how much the jolt from a 30KV capacitor in a 60's vintage television fly-back circuit hurts.)

Russell,

My 530s had the same symptom, and found the Bandswitch coupler in the RF cage was broken (brittle). Might think about checking that. BTW, if you see your Bandswitch is sloppy, might be a good sign that this is one of the problems. Hope you get it repaired. Great rig for sure.

I was listening on my ts 520 s yesterday and then cut the volume all the way down. While web surfing, a short occurred around my keyer and put the radio in full transmit on cw. At about 100 watts. This was for a long time. When I did notice, i felt the fan shroud and it was super hot.

Anyway, I have not noticed any type of degradation in the performance and it seems to have the same power out as before the incident. I have made cw contacts with it.

This caused me to question, was the final section built for such abuse? Is this something the radio can safely handle? Do you think there was any damage to to the radio or tubes?

Brian,

Didn't you hear the TS-520's CW side tone during the long key down period???? If the 520's semi break-in is working (VOX Turned ON in CW mode) and the CW key is pressed/held down or the keyer paddle was pressed and held, you should have heard the CW side tone in the speaker which would have indicated there was something unusual going on.

The 520 is not designed to operate at full continuous RF output for a long period of time. However, if after the long key down period at 100 watts output, the TS-520 is still working properly then there appears to be no damage to the radio. Just be careful in the future when moving items on the desk around especially close to the CW key/keyer paddle etc.

Hi Terry,

Adding to this thread since my 820 is on low side too. When I tune up into a dummy load at the point you are supposed to dip the plate I can never really see any meter movement on any of the bands. I did the test for driver tube that is mentioned in your notes or someone's else's and it holds stable no fading, I replaced finals with 6146W, originals are 2001's. I'm not at the rig right now but I'll get back to you later with HV readings.

So wondering with no dip movement if that narrows down the issue with power output?

Thanks again for all you do for us owners.

1.Are you performing the initial plate current dip with the Plate Load capacitor plates fully meshed (full CCW position)? If not do so as it will give you a much more discernable plate current dip.

2. Have you tried turning the Plate Tune capacitor 360 degrees? If coupler is loose and slipped out of sync with the cap rotor it is possible that the dip will no longer occur at the band specific white marks on the arc behind the knob.

3. If still no dip with the Plate Load cap plates fully meshed might want to remove rig covers and PA cage cover and make sure that the Plate Tune (Tank) capacitor plates are actually turning and that you dont have a loose coupler. Of course rig is to be downpowered and unplugged and HV caps discharged for this inspection.

I would perform a detailed visual inspection. The Driver tube is your weak link. Cant visually inspect. Testing procedure has been addressed here numerous times. Is on my website as well. Just make sure to turn off SG switch as no need for Finals to produce any IP. Make sure to rest Driver tube between each band test.

Some things to look for:
1. Smell the power transformer. Most folks are familiar with the odor of burned insulation. Look around the transformer for any signs of varnish that has melted and leaked out. It will be brown to dark brown.

A. Remove PA cage and look at RF plate choke to see if windings are discolored.

B.Look at small VHF choke to see if it is discolored.

C.Look at RF bypass cap to see if any cracks or splits.

2. Look HV, 300, 210 filter caps rupture vents. Look for swollen and /or cracked vents and if there is any substance oozing out of the vents (brown/black tarry)

3. Look at the two 470 ohm Pi filter resistors on the HV rectifier board for signs of discoloration.

4. Look at the cathode resistors and SG stoppers for any signs of discoloration.

5. Look at the plates of the Final tubes. Especially at sharp creases. All surfaces should be black or grey depending on kind of final tube and no shiny metal. Look at the areas that are in the shadows of the flash getter rings. No shiny silver bare metal.

6. Look behind the Driver tube at R70 and R71 SG dividers. R70 82k is commonly burned up even under best of conditions.

Terry K9TW

Welcome to the Yahoo Kenwood TS-520_820_530_830 Amateur Radio Group. This group is comprised of members who's interest is in maintaining and operating the Kenwood TS-520, TS-820, TS-530, TS-830, TS-510, TS-511, T-599/R599 and R820 Hybrid transceivers, transmitter and receivers. In addition, the group supports discussions covering the associated Kenwood accessories such as the VFO-520, VFO-820, VFO-230, and VFO-240 remote VFOs, the Kenwood antenna tuners, and the various Kenwood desk and hand microphones.

This is a restricted group requiring membership approval prior to receiving and posting messages to the group. To join the group simply complete the Yahoo Kenwood TS-520_820_530_830 Group's application process by clicking on the “+ Join Group” icon on the group's homepage. Select the desired method of receiving messages by clicking the appropriate radio button, then provide a brief description about yourself to include: your first name, your Amateur Radio call sign, your interest in the Kenwood hybrid radio, and the model of Kenwood hybrid you own, operate, or in the process of purchasing in the text box provided. If you are not a licensed Amateur Radio operator, no problem, simply complete the application process and provide the same information less the Amateur Radio call sign. Once you have completed the text, click the Join Group icon. Your application will be reviewed and approved by a group co-owner or Moderator. If you leave the application text box blank, your application for membership will be rejected. Simply reapply and provide the information requested and resubmit your application for membership.

New members are placed on a "Moderate" status. This means that any message a new member posts to the group must be approved by a group co-owner or Moderator before it appears on the group server for all members to see. The length of time a new member remains in a "Moderate message status" is determined by the members ability to adhere to, and follow the group's policies. The faster the new member(s) can prove they are adhering to, and following the group's policies, the quicker the new member's status will be changed to “Allowed”.

The “Allowed” status means the member can submit/post their messages without group co-owner or Moderator's approval. A member who's message status is set to “Allowed” may have their message status changed to "Moderate" if it is deemed necessary by a group co-owner or Moderator for one of the following reasons:

1. Failure to follow the group's policies after being informed by a group co-owner or Moderator
2. Knowingly violate any of the group's policies
3. Any improper behavior by the member that is deemed inappropriate by a group co-owner or Moderator

The group is moderated by both group co-owners and group Moderators. While we would like to have a group co-owner and/or Moderator present 24/7, that is not possible, as group co-owners and Moderators have a life too. Therefore, there will be times when a group co-owner and/or a moderator will not be present. This will affect the time a moderated member's messages may take to get approved/rejected. This occurs most often during major holidays Also, the group's server is not maintained by the group co-owner(s) or Moderators.

Therefore, when Yahoo has problems affecting Yahoo Groups, ALL members will simply have to wait for Yahoo to fix the problem. Group co-owners and Moderators also do not have any control over how the group's server handles attachments to messages or how message search results are provided.

Page 1

As stated above, this group has a set of policies that all members must agree to and abide by. If any member, new or old, that feels they cannot accept the group's policies, that member is free to terminate their membership at any time without notifying the group co-owners and/or Moderators.

Group's Policies:

1. Profanity of any type, regardless of the word and/or phrase(s) used in a message, is not allowed. This includes the use of abbreviation to improper words, use of symbols to substitute for letters, etc. In short, the use of profanity is NOT ALLOWED, PERIOD!!! The quickest way to get banned from this group is to use profanity!!!

2. Disrespect/Flaming any member regardless of the reason, is not allowed.

3. Taking over a thread by a member that changes the threads original subject and content, is not allowed.

4. Messages that contain as part of the message text, discussions of a member's private life are not allowed. Responses to messages are to pertain to the original message subject.

5. Long discussions that are products of an original messages are not allowed. If there are 2 or 3 members who wish to discuss a subject in more detail and at great lengths should take their discussions off the group and continue their discussions using private email addresses.

6. MESSAGES THAT DO NOT CONTAIN ACCEPTABLE MESSAGE SIGNATURES, WILL BE SUMMARILY REJECTED! It takes less than 5 seconds to ensure your message contains an acceptable message signature. There is no excuse for not adding a message signature to your messages. Political or religious signatures/statements are not permitted.

The following are examples of the ONLY acceptable message signatures:

Licensed Amateur Radio members:

Example:
“73s
John WA1ABC”

Non-licensed members

Example:

73s
Mary

If a member does not wish to include their Amateur Radio call sign in their signature, then simply use their first/given/Christian name ONLY, same as non-licensed members.

Each message signature must be positioned at the bottom of the message text and separated by at least one line.

For example:

Hi John,

Yes capacitor C25 is the right cap you should be checking. For details, review the schematic.

73s
Bill

Screen names such as JLH524 or MWPO125 are not acceptable message signatures. Screen names are acceptable ONLY when used as part of the member's email address.

The member's email address is not an acceptable message signature, regardless whether the member's name appears in the email address or not.

A member's “initials” are not acceptable as a messages signature.

A member may add up to 2 additional lines to their message signature. The additional 2 lines may contain a link to the member's website and a link to the member's Amateur Radio club etc. The addition of 3 or more lines to the message signature, listing the many different clubs the member belongs to, the positions they hold within the respective club(s), their professional position within the company the member works for, and other information is considered excessive and not allowed. The following is an example of an acceptable message signature containing two additional line:

73
Mike-w5rkl
www.w5rkl.com
Yahoo Kenwood TS-520_820_530_830 Moderator (Mike-w5rkl is no longer a Moderator, but used as an example--tnx)

In the past there have been members who state our group policies are too strict. We maintain strict group policies for 2 simple reasons:

1. To maintain good order and discipline in the group.
2. Provide a friendly group where all members are treated equally and an environment free of improper behavior

Topic: 54620 Message: 54982

Rules pertaining to Occasional For Sale and Want to Buy Posts.

Members of the TS-520_820_530_830 Yahoo Group who have been members for at least 30 days may place " for sale" posts no more frequently than two in any 30 day period." Want to buy" posts are permitted immediately upon membership and are limited to 2 in any 30 day period.

For sale posts are limited to the sale of TS-510, 515, 520, 820, 530, 830, and the 599 series twins, as well as Kenwood accessories intended for use with these radios.
Also, group members may post "service equipment" for sale. This may include, but are not limited to: vtvms, various signal generators, and other testing/service equipment. Posts must include: the make and model of the item for sale, as well as an accurate description of its condition, and the asking price.

When the item is sold, please make a short post to that effect.

Replies and discussions regarding these posts must be taken off of this group either by direct e-mail to the seller or as directed by the seller.

Buyers and sellers are on their own. The TS-520_820_530_830 Yahoo Group, its owners, co-owners, moderators, or members other than the seller, hold no responsibility for the accuracy of the posts or the credibility of the seller or buyer.

We do not expect that members of this group will misrepresent, or in any way cheat other members. At the co-owners(s)/moderators discretion, we may choose to ban any member from making further for sale posts, or ban the member from this group entirely if we believe their posts or transactions are not of the utmost integrity.

We ask that those who buy and sell equipment as a main business not post here. We will allow posts from members who occasionally restore and sell equipment/accessories as stated above.

We expect our members to use discretion. If excessive traffic develops as a direct result of these postings, they may have to be discontinued.

Joseph T Stiles, WB7UQU

54983. Re: Interface Digital modes and CW

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-01 15:01:34 UTC
From: kk6fut@...
Topic: 54980 Message: 54983

Frank,

The question about CW keying & PSK31/digital are two separate questions, I think.

I've had fairly good success running digital modes (PSK31 and JT65) on the TS-520, running a simple isolated interface from the PHONES output on the front of my rig and a modified Kenwood 4-pin microphone connector, with isolation using two RadioShack audio transformers. There are hundreds of documents on using these, but here's one with a diagram (look at the second one on the page):
http://www.qsl.net/wm2u/interface.html http://www.qsl.net/wm2u/interface.html

Optionally (which I've also done) is to use a USB sound card with built-in audio isolation transformers. Harder to find, but essentially the same thing. I have been using VOX triggering, rather than hassle with RTS/CTS/key interfacing. The isolation transformers may not be required -- you may be able to get away with direct connections of your MIC/GND/SPK wires to your sound card -- but watch for hum and ground loops.

Tips and observations on PSK31/JT65 (and RTTY):

1. Make sure you TURN DOWN POWER (!!!). In my case, by turning DOWN microphone gain. Two reasons why A. digital modes really only need 15-20watts to get out there, and any more splatters the band, and B. digital mode is 100% duty cycle, which is a lot more stressful on the components.

2. In JT65, you can actually get away with less... a lot less. Signals can be heard sometimes in the < 1 watt range, so don't overdo it!

3. In my rig, the crystal filters do not appear to be quite as effective as expected in digital modes, an you actually end up transmitting DSB (dual sideband) -- one strong signal on USB, and a fainter signal on LSB... You can actually decode both at a remote station. I don't know if that's a design limitation or just an artifact of my particular TS-520 and its SSB filter. I also find the frequency response of my crystal filter is a non-linear audio response (good for that nice Kenwood sound... but not so good for digital signals). That means some signals at the far end of the crystal (high or low freq) show up strangely in something like FLDIGI, and can't be decoded.

4. Depending on what rig you have, you might have to adjust your VFO by hand to land in the right area (i.e. 14.070). Running a rig without an accurate frequency readout in the highly accurate world of digital, means it's a bit of an art tuning to the right frequency.

In terms of CW keying, that's an ENTIRELY different question. You will need to connect up the appropriate circuit (using either a Reed relay or appropriate transistor) to do the keying. I've used a relay version with great success (with lots of clacking, of course); a transistor circuit to connect PTT/ground would probably work too (provided it can handle the current, of course) -- but I haven't tested that on my 520.

Anyway, good luck! (and TURN DOWN your MIC GAIN/POWER!!)

Ben

I have an 820 speaker that had some sort of gadget setting on top of it with it’s prior owner. The feet on that gadget were of some sort of rubber that apparently slowly became tacky over the decades. Now there is residue of those feet stuck on the 820 top case. The residue is also soft and I’ve tried to rub it off but that just seems to smear it around. I’ve not tried any sort of solvent for fear of damaging the underlying 820 speaker paint finish.

I would guess some of you know what I’m talking about. And hope you may have a suggestion on how to remove the residual black foot gunk.

I'm needing to downsize so am selling my TS-520SE. This is in excellent condition - previous owner was a doctor who had little time to operate. CW filter installed. With manual and mike. I'd rather sell it in the area (I'm in the Shenandoah Valley, VA) but can pack it up and ship it if needed. $225 plus shipping. Email me if interested and/or would like more information.

Jeff,
Try acetone (nail polish remover). It'll take the gunk off ... as well as the paint. Then take the cover(s) off the speaker and repaint them high gloss black. The results are striking (and it will come closer to matching all the other stuff in the shack that already comes black. I have repainted both a 530 and an 830 black ... they are stunning. When I put them up for sale, they both went quickly.

At any automotive store (Kragen/Auto Zone/O'Reilly's, etc.) look for a spray can of tar and grease remover. Should do a good job, albeit might take a few applications, and, won't hurt the paint on the case.

I've used it to remove tape residue on dials and faceplates, as well as 'melted' plastic feet/tabs, with great results.

K-Mart and WalMart's automotive department should carry the can too.

Yes not uncommon for it to fail and not just lose emission. it is configured in Class A and plate current is near maximum (approx 25ma) allowable for the tube. Look at the TS820S Operating Manual and read Note 2 under the transmitter loading steps. The note should be in all the Hybrid manuals.

Fuse typically only blows if there is hard or bolted fault and not if you are exceeding the plate dissipation of tubes or the transformer VA rating. I would also check the fuse to make sure it is a 6A 250 volt fast blow. If not change it to proper fuse.

I see lots of automotive fuses, time delay fuses, and have a TS830 on the bench now that has a 30amp fuse in the holder along with a burned up transformer, PA cage, and Final board. Very sad.

54996. For Sale: TS-520S station

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-03 16:05:55 UTC
From: stg57@...
Topic: 54996 Message: 54996

Hello Group,

Before listing this on QRZ, or on Ebay, I wanted to post it on this site first. Since I don't check the group mail as often as I use to please contact me at Ws4jh63@Gmail, or Stg57@yahoo.com mailto:Stg57@yahoo.com.

What I have for sale is a TS-520S, VFO-520S, Johnson Desk Mike (Heil matching transformer to match rig), PC-1 Phone Patch, AMP Cable, and a Arduino+Shield frequency counter (DG-5 Clone Project) the frequency counter has not yet been mounted in a project box, as the box I have has no room on my shack desk.

The Rig has had the Power Capacitors replaced, Ken's PA cage parts have been installed, lights are working, and has been used on the air with no problems a number of times over the last years.

If you want to complete a tune up on the Rig, I will include a bag of coil cores I have pulled from some other 2-way gear of the same vintage. A couple of the cores were already cracked when I got the Rig a number of years ago, and since it worked OK, I did not mess trying to make any improvements by giving it an alignment. I build bicycle wheels for road bikes, yet I can not true them to save my life, I have someone with those skills that knows what they are doing.

It has just got to the point with work that I have little time, and more bills than income, so it is time to part with some loved toys.

I am asking $425.00 Shipping is not included. I am willing to deliver within 100 Miles =/- from Boone NC. I can also pack well in double boxing, and ship insured with the postal system since they have provided the best safety and reliability of the people I have used. I am open to reasonable negotiation.

Photos and Phone number available on request.

There shouldnt be in black spots on the inside of the tubes glass envelope at the top of the tube.

Should be a circular or oblong shaped black mirror like spot (coating/deposit) on the glass envelope at each getter ring. All have two getter rings. Some on opposite sides of the tube glass envelope. Some on same side vertically oriented. Some have one large flash coating on just one side with the two getter rings horizontally oriented. Turn the tube and you should be able to see the small silver getter ring behind the flash deposit.

Matsushita 2001A tubes (commonly used in early production) have the two flash getters deposited at the bottom of the glass envelope and are only partially visible above the top edge of the phenolic base.

The black mirror like spot is a coating of barium which is deposited thru induction heating of the getter ring during final stages of vacuum pump down. Barium is highly reactive and will oxidize off gassing products. When it does that it is expended in the process and the black mirror like deposit will slowly turn greyish white unless there is a gross inleakage of air in which case it will be completely expended and turn totally grey/white and tube is then not usuable.

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started its existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Saturday net was run by Mark, WB0IQK. There
were 9 stations checking in under poor
conditions. There were 3 new check-ins today: KC2ZVB, WQ1Z, and KC9ARS.

We had the following number of radios checking in.

1 running TS-520(x)
1 running TS-530(x)
1 running TS-820(x)
1 running TS-830S
0 running TS-510
0 running TS-511
0 running TS-515
0 running 599 twins
0 running TS-900

I was running my TS-830s and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
10 stations checking in under very poor band
conditions. There were 1 new stations checking in: K7CAE.

We had the following number of radios checking in.

3 running TS-520(x)
1 running TS-530(x)
1 running TS-820(x)
2 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and

TS-940□s, which of course is not a hybrid,
although over 30+ years old. Everyone is welcome
as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHo
mePage.htm

To date, we have had the following check-in:

Nov. 2011 □ Oct. 2012 Saturday total 754
check-ins, Sunday total 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 □ Oct 2015 Saturdays total 962 check-ins, Sunday total 669 check-ins

November 2015, Saturday net total = 66, Sunday total = 46
December 2015, Saturday net total = 55, Sunday total = 73
January 2016, Saturday net total = 129, Sunday total = 81
February 2016, Saturday net total = 98, Sunday total = 72
March 2016, Saturday net total = 74, Sunday total = 35
April 2016, Saturday net total = 101, Sunday total = 57
May 2016, Saturday net total = 51, Sunday total = 32
June 2016, Saturday net total = 39, Sunday total = 46 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

There are definitely two black spots opposite of each other at the top of the tube. I assume it came from the radio being on tx for so long. They are still strong at 100 watts! Thanks brian kb4mng

55002. Kenwood 830s RX cuts out almost immediately

While listening on my Kenwood last night my Kenwood receive cuts out. The display goes blank as well. The speaker still has power and when I press the transmit button on the microphone you can hear the relay switching. It acts like it has a bad connection, losing power to a board. When powered up the display and audio work for about 2 seconds. Suggestions or ideas of where to start looking for the issue would be much appreciated.

Not sure what you are referring to, but if it is a complete power out, you probably have a bad plug at rear. My 530 did the same thing. Good luck, and be careful probing around.

There is so much information on the web that covers these subject rather well.

Tom Rauch, W8JI, website has a lot of information on gettering. Tom has a nice write up on high power transmitting tubes such as the 811/811A, 572B, 3-500Z, 4-400, and 4-1000 that do NOT have a getter element like small receiving tubes and low power transmitting tubes have. High power tubes such as the ones listed above have their Anodes coated with "Zirconium", a material that, when subjected to very high temperatures, absorb gas/air. This is indicated when the tubes have a dull red glow during normal transmitting. The worse thing one can do when operating an amp with the above tubes and the anodes show a dull red glow, is to reduce drive to eliminate the anode glow. Doing so reduces the effectiveness of Zirconium on the anode in absorbing gas/air. Naturally, the tubes should never shows a bright red glow as that clearly indicates a problem.

www.w8ji.com

At no time should any receiving tube such as a 6AU6, 6BZ6, 12AU7 or low power transmitting tube such as the 6146, 2E26, or 6BJ6 show any color on the anode. If color is seen on the anodes of any of these type tubes, the circuit should be shut down immediately and the source/cause of the problem fixed to eliminate the anode glow color!! Don't mistaken the flow of the filaments as glowing anodes, the filaments MUST glow in order to reach the high temperature required to emit electrons!!

There are some voltage regulator tubes such as the OA2/OB2 that show "Purple" glow inside the anode. That's normal and should not be assumed to indicate a problem. There are also Mercury Vapor rectifier tubes such as the 866 and 3B28 that show a "Purple" glow during normal operation. The glow is the result of the small amount of Mercury inside the tube that is heated to a "Vapor", hence the name Mercury "Vapor" rectifier. The 866 requires a short period of time to occur when filament is applied before B+ HV is turned ON. This short period of time is to allow the Mercury to heat to a Vapor at which time the B+ HV can be turned ON. The 3B28 has a much shorter period of time, see the data sheet for both 866 and 3B28 for details on the delay period.

The following link has a nice write up on how vacuum tubes are made.

http://www.vacuumtubes.net/How_Vacuum_Tubes_Work.htm

I also recommend hams who will be working on vacuum tube circuits to read up on vacuum tube theory and the different classes of amplifiers. One can't fix a vacuum tube circuit is one has no clue how a vacuum tube works!!

Things to try; Headphones plugged in, hear signals ?Tune and see if S-meter deflects when you pass a signal on a busy band. If you have tech experience with high voltages, open her up and clean T/R relays fopr starters, inject audio tone at volume center pin and rotate the control. I f you have not worked on radios before get some experienced help. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

lolol.... Then there are those of us who learned vacuum tubes -first-.

Transistors were those scarce, expensive things that rich folks had, and they didn't work all that well anyway. (Hand-held transistor AM broadcast band radios were the BOMB. You could tinker them up to get the shortwave bands between one and three megaHertz without too much trouble; usually just an extra capacitor and some patience did the trick.)

And all of the neat projects in magazines and books that more or less started with disassembling a 'dead' television for the parts. My first 900V B+ power supply, built into a steel kid's microscope kit box, was made from junk parts stripped from a bunch of old televisions and radios. Rewinding transformers and drilling out rivets to get tube sockets off of TV chassis, great times and tons of fun. The smell of rosin solder flux brings back fond memories. It's a wonder I didn't die of lead poisoning.

I really kind of miss those days. Not the lead poisoning part, but the sense of personal discovery and a sort of freedom. I got shocked so many times messing around with tank circuits and diode tube HV power supplies and the like, I could probably have spit sparks. Tinkering now-a-days is so much less exciting. I can't get the same spirit from truth tables and logic diagrams. Flip-flops just leave me cold.

We had so much to learn and you could do such amazing things with salvaged junk.

Very interesting that you brought up building a radio from a junked TV. That is one of the reasons I am in ham radio. I was always interested in electronics. In the late 70s early 80s I would check out all the electronic books from the local library. One was titled making a ham radio from a TV. I spent hours reading the book. The sad part was that book was very old and that was not a possibility with the junk TV that I had. Took me awhile to realize that!
Was that really possible back then? Could you actually make a viable ham radio from a TV? How difficult was it?

Building ham gear back in the "old days" was not solely by using parts from an old TV set. Discarded radios, phonograph players, old car radios found at the "city dump", along with discarded electronic devices were gold mines for parts. Yes I visited the local county dump and found plenty of discarded electronic equipment, not so today. Power transformers from old TV sets provided the AC filament and HV for the power supplies for a receiver and transmitter. IF cans from old radios, quite often 455Khz, provided the IF cans for a receiver. Vacuum tubes from old TV and Radios provided the tubes. Discarded TV, radio, and other electronic equipment also were a source for resistors, capacitors, and wire for building circuits.

There was no internet back then where a ham or would be ham could ask for help. Many hams or would be hams either had an Elmer to help them, they joined or belonged to a ham club that had ham members who actually had basic and advanced electronic knowledge, or they learned by spent time reading/studying the theory then put that theory to work by building simple circuits FIRST.

Many hams or would be hams learned receiver theory by studying basic AM receiver theory. They knew if they had no clue how a simple single conversion AM receiver worked, how it processed a signal from the antenna to the speaker, They knew the importance of learning how a simple AM receiver worked, how the AM receiver processed a signal from the antenna to the speaker.

Electronic magazines such as Popular Electronics, 73, QST, the ARRL handbook as well as others contained simple circuits a ham could build. Hams learned by studying the theory then building simple circuits at first, moving on to more advanced circuits once they had a solid foundation in the basics.
Knowledge is not something that jumps out at you. One has to spend time studying the basic theory then put that basic theory to work by building simple circuits first. Jumping head first into advanced circuits without having a solid basic knowledge foundation is a recipe for disaster.
Last, can a receiver or transmitter be built from parts from of an old TV, discarded radio and other electronic devices? The answer is "Yes"!!

Brian, there were still big HV transformers and filter capacitors in a TV that supplied roughly 300 & 600 VDC to run all the tubes and lower AC voltage to light the filaments. Available for free in the 60s. That was nice to build up a power supply for your mid power transmitters. Tube sockets could be salvaged, many various resistors and capacitors and control "pots" were in there too. I had a few WW2 surplus receivers I got going and the homebrew transmitters were no too hard to get on the air. For me it was all CW and that really made things simpler to get on the air. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Well...I finished up my DG-5 Emulator project this afternoon. Downloaded the software to my Arduino. Mounted the shield. Powered everything up to make sure it would. Went to connect it to my TS-520 (yes, I said TS-520), and realized that the required CAR/HET/VFO outputs are not on the TS-520!!! DOH!!!

I guess while I was researching this it didn't occur to me that the TS-520 might not have these outputs. I admit, I'm not completely familiar with the back side of the rig. I know there are a lot of things back there I don't currently us, and I assumed the CAR/HET/VFO outputs were one of those.

Suffice it to say, I have what appears to be a working DG-5 emulator (powers up fine and shows the KV6O information on the LCD screen, but obviously I'm not able to test the actual frequency display. So, that being said, I would like to recover my costs from the project if possible. The project is not mounted in a box, but has the project board, LCD screen and ribbon cables for the LCD. I will sell all of these for $30. If you would like for me to throw in the Arduino as well, I'll take $50 for everything. If interested, please email me at skip dot waisner at gmail dot com.

Thanks,

Skip Waisner

55015. Quick question

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-09 00:12:26 UTC
From: kg6dhq
Topic: 46056 Message: 55015

Hello again from KG6DHQ, Bob

My 830 quit transmitting, so I replaced the 6146 tubes with some 6146W's that I purchased at a Ham swap meet. I went through the neutralizing procedure using a second radio. I could see very little change on the S-meter, but dipped for the lowest. The 830 now seems to be putting out about 85 watts on 40 meter CW.
Now the question...what happens if I did not do the neutralization properly ? Can the rig be damaged ?

Thanks, Bob

55016. Ruined Another Perfectly Good TS-830

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-08 21:53:47 UTC
From: jstoneback@...
Topic: 55016 Message: 55016

Oh boy! I've really done it now. My newly acquired TS-830s seemed to have lower overall receiver gain, compared to my TS-520 maybe an S-unit down? Otherwise the rig works OK receive and transmit, tuning up to 100 watts on 80, 40 and 30.

Yesterday, after it arrived, I installed a YK-88-C filter. Thinking maybe I had disturbed something, I did a little fiddling, unseating and reseating molex board connectors on the IF board, removed the antenna relay and cleaned the contacts. I even pulled the finals out to see what kind were in it (RCA 6146Bs).

Now, the rig has no transmit output, (almost). All receive functions are nominal, sidetone works, relays click, bias adjusts to 60 ma, and HV at the top of the plate chock measures 940 v - no load. Screen grid switch is in the ON position. It worked well enough before I started messing around.

With the carrier level control all the way up (clockwise) I can get a small deflection in the RF meter mode when I key it on CW. Plate tuning, loading, and drive controls all peak the RF meter. Switch to IP and there's no increase in plate current with key down. But there is about 1 watt output showing on my LDG auto-tuner, enough power for the tuner to find a tuning solution.

I notice that the driver tube is very hot, but don't know whether that' normal.

Can the antenna relay be installed backwards? The pins are numbered on the bottom of the relay, but I don't see any index mark on the socket.

Drat! I hate that I broke this thing already.

I blew up the last TS-830s I had - power supply smoked, boards over-voltaged. After the fact the guy I bought it from said, Oh yeah, it had the high power mod in it; you shouldn't try to operate CW with it. Knew I was a CW op.

I'm at a loss - only test gear is a DVM and a frequency counter - I'm not much at troubleshooting anyway. I guess I should send it to someone who knows what they're doing.

HELP ?

Just a quick question. To read your output on a 530S, what is your meter set on to read output in watts, or do you convert it?

Thanks
George/wd4hbc

Skip,

If you go back to the KV6O site. He has another article by WA2FXM on how to modify the TS-520 to use the DG-5 Emulator. The best way to find it is to google WA2FXM and look for the link with KV6O in it.

Subject: [TS-520_820_530_830] For Sale: DG-5 Emulator

Well...I finished up my DG-5 Emulator project this afternoon. Downloaded the software to my Arduino. Mounted the shield. Powered everything up to make sure it would. Went to connect it to my TS-520 (yes, I said TS-520), and realized that the required CAR/HET/VFO outputs are not on the TS-520!!! DOH!!!

I guess while I was researching this it didn't occur to me that the TS-520 might not have these outputs. I admit, I'm not completely familiar with the back side of the rig. I know there are a lot of things back there I don't currently us, and I assumed the CAR/HET/VFO outputs were one of those.

Suffice it to say, I have what appears to be a working DG-5 emulator (powers up fine and shows the KV6O information on the LCD screen, but obviously I'm not able to test the actual frequency display. So, that being said, I would like to recover my costs from the project if possible. The project is not mounted in a box, but has the project board, LCD screen and ribbon cables for the LCD. I will sell all of these for $30. If you would like for me to throw in the Arduino as well, I'll take $50 for everything. If interested, please email me at skip dot waisner at gmail dot com.

Thanks,

Skip Waisner

George,
You can not directly read RF output in watts on the meter of your rig. The RF position of the meter selector in an indication only, but may be adjusted to give you a good idea of the output. Say you tune up your rig into a dummy load with an in-line watt meter...and indicate 100 watts on the meter, you can then adjust the RF volt control on the rear panel to have the needle read any convenient major mark on the meter...I use the "300" mark on the mA scale...be aware that the meter selector switch in "RF" and I'm only using the "300" mark as a reference mark. You can use Ohm's Law for power: P = V x I say you have 800V indicated on the meter and you have 220mA indication of Ip. 800 x 220 = 176watts INPUT!Since the final amplifier operates at somewhat less that 100% efficiency, in this case around 60%...you divide 176 by 60% and get around 105watts output. These figures are NOT exact, but give you an example. Best way to measure your output is with a good wattmeter... remember that if using a "averaging" meter, you will only see maybe 30 watts on voice peaks..and only see full output indication with a constant carrier...CW key down

George,

You can obtain a very close approximation of power output by performing
the following simple test.

1. Tune the TS-530 into your dummy load as the instructions state.
2. Note the IP meter indication after tune up
3. Note the approximate HV meter indication after tune up
4. Multiply the IP by the HV to get the DC input power
5. Multiply the DC input power by .6 to get the approximate power output

For example, assume the IP meter displays 225ma and the HV is 825VDC.
The approximate DC input power would be 185 watts

.225 x 825 = 185

The approximate power output you could expect at the rear panel SO-239
would be 111 watts

185 x .6 = 111 watts output

The figures I used are for example only, they do not represent the
actual IP and HV values you will see. Your actual IP and HV figures will
be different but the formulas provided are valid and will give you the
approximate DC input and output power in CW mode.

YES, the 520 is a pretty basic radio. Once you learn to use the calibrator, the Digital display is REALLY not necessary. Do you write frequencies in your log more accurately than the single KHz level? Do you even use a log book? Do you get so close to a band edge your signal may be out of band? My radio is Ham Radio...CW is Real Radio 73, John...K8JD

You could also build a duplicate of the original Kenwood DK-520
HET/VFO/CAR circuit that mounts on the rear of the KW TS-520 (first of
the 520 series transceivers).

I have the DK-520 manual, with schematic and parts, on my website

Well your in a pickle now. None the less, You will get it back and operating. Since you are not much of a trouble shooting guy, I will give you a few tips. First always check operation before any mod, then one at a time. Check the radio after every mod or routine repair. This way you can always recheck once something fails. lesson over

Now lets start with your issue. You have no power out. This will not be caused by your filter, But the relay thing will affect both transmit and receive, so lets start there. You say you think it may be backwards, highly doubt full. Any relay I have ever dealt with fit by the spacing of the pins. Coil is usually away from contacts by design, but you said you cleaned the contacts. What did you do to clean them? Usually a business card, copy paper strip is all that is needed or a burnishing tool. You say the driver tube is hot. Well yea, it can get hot because it has a filament which heats up the tube. I don't think you have an issue there. I thing something is array with your antenna relay or you loosed a pin on some or one of the Molex connectors. Get a schematic and check some voltages. It's lethal in that final cage, so watch out. Recheck the sea tug of your plugs. Let me know. Brad KB2CHY

Subject: [TS-520_820_530_830] Ruined Another Perfectly Good TS-830

Oh boy! I've really done it now. My newly acquired TS-830s seemed to have lower overall receiver gain, compared to my TS-520 maybe an S-unit down? Otherwise the rig works OK receive and transmit, tuning up to 100 watts on 80, 40 and 30.

Yesterday, after it arrived, I installed a YK-88-C filter. Thinking maybe I had disturbed something, I did a little fiddling, unseating and reseating molex board connectors on the IF board, removed the antenna relay and cleaned the contacts. I even pulled the finals out to see what kind were in it (RCA 6146Bs).

Now, the rig has no transmit output, (almost). All receive functions are nominal, sidetone works, relays click, bias adjusts to 60 ma, and HV at the top of the plate chock measures 940 v - no load. Screen grid switch is in the ON position. It worked well enough before I started messing around.

With the carrier level control all the way up (clockwise) I can get a small deflection in the RF meter mode when I key it on CW. Plate tuning, loading, and drive controls all peak the RF meter. Switch to IP and there's no

increase in plate current with key down. But there is about 1 watt output showing on my LDG auto-tuner, enough power for the tuner to find a tuning solution.

I notice that the driver tube is very hot, but don't know whether that' normal.

Can the antenna relay be installed backwards? The pins are numbered on the bottom of the relay, but I don't see any index mark on the socket.

Drat! I hate that I broke this thing already.

I blew up the last TS-830s I had - power supply smoked, boards over-voltaged. After the fact the guy I bought it from said, Oh yeah, it had the high power mod in it; you shouldn't try to operate CW with it. Knew I was a CW op.

I'm at a loss - only test gear is a DVM and a frequency counter - I'm not much at troubleshooting anyway. I guess I should send it to someone who knows what they're doing.

I'm coming back to radio after years away, have a TS-830s with (as best as I guess) no mods. It had one previous owner who bought it new in his later years. The rig works almost completely well. In most ways, it's great.

However, in receive mode, there is no deflection of the S-meter, no matter the strength of the received signal. It does this on all bands.

The meter responds properly to rotation of the RF gain. Fully CW, the meter shows zero, and as RF gain is rotated CCW, the baseline moves to increasing S reading, finally pegged for full CCW. But no response to any signal anywhere.

The meter also works properly in all tune or TX positions.

What am I forgetting?

Hi,

Can anyone verify that the YK-88-C is the same filter as the YK-88C-1, just without the plug-in board?

73,

Jim K4AXF

Jim,
they have different center frequencies. The YK-88C-1 has a center freq of 8830.7kHz, the YK-88C has a center freq of 8830.0kHz. You can go to the following link to see the chart. Thanks to Gordon-n6wk(SK)

John,

Thanks for the reply. I realize that the digital frequency readout is a luxury, but I built it more as a fun project than a requirement for me to operate. Technically, if we used crystals only, we wouldn't even need to have a dial to read. I do use a logbook, and would like to make sure I am logging QSOs as accurately as possible.

Thanks again,

Skip

Hi George,

The KW hybrid meter switch has 2 positions that provide information to calculate RF input and output power. One is the HV position which displays the final amplifier's approximate DC Anode (Plate) voltage and the other is the "IP" switch position that displays the approximate 6146 final amplifier cathode current (same as the PLATE current).

After tuning the transmitter into your 50 ohm dummy load then leaving the transmitter keyed in CW mode a few more seconds. Quickly set the meter switch to HV and note the meter value then quickly set the meter to IP and again note the meter value, then unkey the transmitter. The HV and IP values will be used to calculate the DC RF input power. The answer found will then be used to calculate the approximate RF output power one could expect to see at the rear panel SO-239 antenna connector.

We use the math formula:

Pin = I x E

where:

"I" is the IP meter indication
"E" is the HV meter indication
"Pin" is the final amplifier's DC input RF power level

I'll use a simple example using IP and HV values. Note, your values will be different.

The IP meter displayed 220ma (.220 amps)
The HV meter displayed 825VDC.

We substitute ".220" for "I" and "825" for "E".

We now calculate the final amplifier's DC RF input power which is approximately "181 watts":

.220 x 825 = 181 watts

The KW hybrid final amplifier operates in Class AB1 which has a typical efficiency percentage rating of 60%. To calculate the approximate final amplifier's RF output we simply multiply 181 by ".6" (60%) which results in an approximate power output of 109 watts at the rear panel SO-239 antenna connector:

181 x .6 = 109 watts OUTPUT

If you have a watt meter, you can compare the watt meter power against your math calculation power level, they both should be rather close.

As said, there is no "Watt meter" switch position in any of the KW hybrid meter switch. The "REL PWR" meter switch position simply displays a sampling of the RF power. The meter level is set by the "RF VOLT" pot on the rear of the 820, 530, and 830 and the side panel on the 520 series transceivers as stated in the operator/user manuals of the appropriate transceiver. The REL PWR switch position also has no scale, only the position of the meter pointer is used. If it makes you feel "warm and fuzzy" using the top IP current scale then have at it but just remember none of the meter scales are used nor do they relate to the REL PWR meter switch position.

High voltage measured at the 800V point on the rectifier board 667 Volts .
Output in Tune 25 watts , somewhat higher in CW .All three tubes are verified via installation and testing in a similar circuit (Tempo 2020 800V , 200V screen)
No indication in IP position .
Somewhat broad tune signal when viewed on a distant SDR waterfall . A distinct carrier at frequency with faint lines about 100 either side of center .

I'll have more details soon as I'm up for no other reason poking around tonight .

https://en.wikipedia.org/wiki/William_I._Orr https://en.wikipedia.org/wiki/William_I._Orr William (Bill) Orr was something of a oracle to us during the post war decades . I began reading his work around 1965 . A detector here a rectifier there an amp a mixer ... I still have a "gennie" as well as an old Tuned plate NoT grid (21's then 45's)from early in that era . Commercial gear was expensive . Military gear was outside of a paper route budget and only the trailing edge of Benton Harbor was possible . So I made the best of my antennas . I salvaged sweep tubes from old sets . I cashed in on Allied "lifetime" tubes . I suffered the pitfalls of point to point spaghetti . And I read the gospel according to Bill Orr .

When I returned from the service I had some catching up to do . Helge O. Grandberg became the new prophet of solid state power transistors . Then there was the 8080 , 8086 debate (we know how that turned out) as computers and radio were inexorably intertwined .

Now I sit here reviving boat anchors 40 and 50 years old . I have a Hallicrafters SX-23 in front of me , a HW-101 at my feet , a Tempo 2020 connected to the antenna , listening to a SDR located 800 miles away .

Hi Joe,

Thanks. Yes, that chart shows the YK88C-1 with 8830.0 center frequency. But it also shows the YK-88CN-1 with center frequency of 8830.7 (and with incorrect bandwidth 500 Hz, should be 250 Hz). So, I'm still uncertain , , , ,

I found a copy of the YK-88C Kenwood spec sheet on the web; still unable to find one for the YK-88C-1.

I took the YK88C-1 filter off the little plug-in board and installed it in my TS-830s. It works OK, but your reply does have me wondering if it's working right.

Topic: 55046 Message: 55046

Hello to the group. I am involved in repairs on a few pieces of KW hybrid gear that was given to me to get back on the air with. In great shape with the main rig which is a TS830S, and a VFO-230, all caught up and running for the time being. I am now into some of the stuff that isn't working correctly, and currently, the spare VFO-230. The problem is someone cut a bunch of diodes in the array between d19 and d24 in order to implement a mod which allows the unit to tune in smaller increments. However, it seems to be causing some erratic movements in the dial and display, and I managed to reconnect one diode and get it back where it seems to be right, but; some of the diodes need to be replaced in order to complete the repair as they are physically damaged.

My question(probably easy) is what are the numbers to sub out for the diodes? They look like 1n34's but the service manual has three sepearate numbers and I can't figure out which number is for the little ones I need to replace...anybody?
Thanks and 73.
Riley wd4dkv.

Bob,
Yes, I recommend you look on eBay for the ARRL soft copy titled

"UNDERSTANDING AMATEUR RADIO"
There's a few on eBay now, one for $12.50, free shipping, eBay ad #182185137457
Another ARRL boox, soft copy titled

"A COURSE IN RADIO FUNDAMENTALS"
There's one on eBay for $7.50, Free Shipping, eBay ad #182184141390
Another one on eBay for $8.99 plus $2.99 shipping, ebay ad #291500320619
Another good reference book is:
"William Orr Radio Handbook"
There's one on eBay for $10,00, Free Shipping under eBay ad #262515755118
Plus the ARRL handbooks, I recommend the older editions 1950s to 1980s. The older books have more vacuum tube circuits and theory. The new handbooks are devoted more to solid state/digital circuits but there are some vacuum tube theory and circuits to study.
If you are going to experiment then I recommend you purchase a breadboard, either self powered or powered by external power supplies. You can find a self powered breadboard with built in 2 x 0-15VDC 500ma power supplies and a 5VDC fixed supply. The self powered breadboard can be found at:

allelectronics.com
Now that you have spent time studying basic theory, resistance, voltage, and current, it's now time to perform the "DO' part of the learning process. This requires you to build simple circuits using real components such as resistors and use real volt/ohm/current meters (DMM/DVM) to verify your math calculations. The 3 resistor series circuit on the books beginning shows 1, 2, and 3 ohm resistor in series across a DC source. The total resistance if 6 ohms and the DC source is 12VDC and the total current flowing in the circuit is 2 amps.

Duplicate this circuit BUT increase the individual resistor values to 1K, 2K, and 3.3K for R1, R2, and R3. The total resistance will be 6.3K and with 12VDC applied to the series circuit the total current flowing in the circuit will be "2ma". You can go to Walmart and buy a pair of 6 volt batteries in the camping department, connect them in series, to make a 12VDC power source. You can purchase resistor on eBay, at Radio Shack online website, Mouser, Digitkey, allelectronics.com, or other online part sources. Building the circuits then calculating the total resistance and current flowing in the circuit then actually measuring the values is how you really learn how the circuits work, the "DOING" part of learning. Studying theory is only PART of the learning process, you should also build simple circuit as part of the "DOING" learning process to fully understand how circuits work. The results will be right in front of you on your DMM/DVM so you can compare the results with your math calculations!!!

From: James 'Cid' Cidlik
Topic: 55049 Message: 55049

I did build the little ALC control box. When adjusting the 220K Ohm pot I get no movement on my watt meter until I have almost closed the gap. Very little room to adjust down to 45 watts. To change that do I use a lesser value resister, say 200K Ohm or even less? Thinking that would give me more linearity when turning the pot.

Vic,
This topic comes up often. Simple answer is NO. reason: different frequency spread.
   A look at the block diagram on Pg 24 in the TS-820 Operating Manualshows the VFO output is 5.5 - 5.0MHz(bottom of band to top of band).
The block diagram on Pg 32 of the TS-830 Instruction Manual shows the VFO output as 5.5 - 6.0MHz.
  Also, the connecting plugs are different

Jim,
This is the best info I could find:

				center	bandwidth
YK-88C	8830.7	500Hz	YK-88CN	8830.7	270Hz
Yk-88C-1	8830.0	500Hz	YK-88CN-1	8830.0	270Hz

I found most of the info by cross referencing various models and thefilter(s) available for that model out of the the various owner/instructionmanuals.

Subject: [TS-520_820_530_830] Rigs that use the VFO 820?

  I acquired a NIB VFO 820 from a friend who said their father bought it back in the 80's but somehow never used it. It may have been used , but who knows, looks brand new. I know it will work on my TS 520 & 520s & 820 but will it work on my 530s or the 830s. Just wondering what the group thinks before I hook it up. Thanks NB4T Vic

From: kopcicle@...
Topic: 55042 Message: 55058

Addendum ...

meter no longer zeros at rest with power and heater on .
no IP or RF indication .
ALC however pegs with carrier anywhere past 9:00

Could a fault in the metering circuit pull the HV down from an estimated 798V to 667V ?

curiouser and curiouser ...

Hi All

I was hoping that someone with more experience of the TS-830 might be able to advise me with a few issues that seem to have recently taken place on my TS-830M.

1) There is almost no IP reading when in TUNE mode on any band (IP seems to register normally under CW)2) There is almost no ALC or IP reading on 10m in any mode (and no power output on this band)
3) When in receive and switching from TUNE to CW the frequency counter reading increases by about 5khz.4) When keying down in CW on any band the freq counter reading instantly increases by about 10khz (it drops back again when not transmitting)

I have tried replacing the finals and have the same issues. I have checked that all the switches are in correct positions and tried cleaning them with a dash of deoxit. I have checked the bias and the grid current is set at 60mA. In sideband the radio still provides 100w on all bands apart from 10m and has no frequency shift when transmitting. I am wondering could much or all of this be caused by a dead or dying driver?
many thanks and 73Laurie G0LTG

The VFO-820 has a different frequency tuning range which is 5.5Mhz to 5.0Mhz, than the VFOs in the TS-530 and TS-830 which is 5.5Mhz to 6.0Mhz. Note the difference of 500Khz between the TS-820 VFO tuning range and the TS-530 and TS-830 VFO tuning range. That's why the VFO-820 is not compatible with the TS-530 and TS-830.

There are some hams who were misled to believe that the VFOs in the KW hybrid, both internal or remote, change tuning frequency ranges when the band switch changes. That simply not true. The internal and remote VFOs in the KW hybrids, regardless of the VFO, do not change their appropriate frequency tuning ranges as the band switch changes.

Older VFOs such as the VFOs in the Heathkit Apache TX-1 and DX-100/100B transmitters and the Heathkit Comanche MR-1 and HR-20 receivers as well the Heathkit VF-1 and HG-10/10B and the Hallicrafters HA-5 and the Johnson Viking model 122 all have different tuning frequency ranges for different bands.

Laurie,

The typical CW transmit frequency "shift" as seen on the digital display is approximately 800Hz which is normal. It's possible you may be reading the digital display incorrectly. Note the CW "receive" frequency indicated on the digital display. Next, key the transmitter in CW mode and note the "transmit" frequency indicated on the digital display. Subtract the transmit digital display frequency from the receive digital display frequency which is the CW transmit "shift" that is occurring.

There will be no transmit frequency "shift" when operating side band.

You say the 830 produces normal 100 watts output on side band on all band, slightly less on 10, that's normal. I am going to assume CW transmit produces the same 100 watts output on all bands, slightly less on 10 meters as well.

You said "there is almost no IP reading in TUNE mode on any band". You then said "IP seems to register normally under CW".

Do you have the meter switch set to ALC in TUNE mode?

Perform the following initial transmitter tuning steps:

1. Set meter switch to ALC
2. Set band switch to say 40 meters
3. Set Mode switch to TUNE
4. Set DRIVE control to 12 o'clock
5. Set CAR control between 10 and 11 o'clock
6. Connect the 830 to your 50 ohm dummy load
7. Power up the 830 and allow it to warmup for 30 minutes
8. Flip the SEND switch UP (Keys transmitter)
9. Adjust the DRIVE control for a peak meter indication, ignoring all meter scale. If the meter pegs fully to the right, rotate the CAR control CCW so the meter drops back to 12 o'clock or so, then continue adjusting the DRIVE control for a peak meter pointer indication.
10. Once the ALC peak meter pointer indication in TUNE mode is achieves, leave the transmitter keyed for a couple seconds longer while monitoring the meter. If the meter pointer starts to drop back towards zero then the driver tube is weak and should be replaced. If the meter peak remains stable, does not drop back towards zero, then the driver tube can be considered okay. I could be wrong but I suspect, at leas for now, the driver tubes is okay.

This is the initial driver adjustment for maximum RF drive to the final amplifier and a quick way to check the driver tube.

A "dead" driver tube has no control or affect over the final amplifier's 60ma idling current.

A "dead" driver tube has nothing to do with the CW transmit shift seen on the digital display.

A "dead" driver tubes would not produce 100 watts output, as you said, on side band and as I assumed also on CW.

55063. TS-820S several issues looking for a starting point

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-12 15:11:02 UTC
From: n1psx@...
Topic: 55063 Message: 55063

After rearranging my shack, although not moving the TS-820S system, I have some issues now with that system.

Background: the system consists of the the TS-820S radio, the VFO-820, the SM-220, the AT-230 antenna tuner, and the SP-820 speaker.

Everything was working as it should prior to changing some things around in the shack, but as I said, no changes were made to the Kenwood system, except that an antenna tuner for a Yaesu FT-450D, by LDG, was placed atop the VFO-820, itself sitting on a shelf above the radio. The grounding braid from this antenna tuner does now pass behind the VFO and off to the side of the radio.

What I get now is no audio from the radio, zilch, and the VFO LED does not light when turned on. It lights very momentarily while the rotary switch is being turned, but then goes out.I do see the band scope indicating a peak in the center of the scope regardless of where I tune, which makes me think there is a signal in the IF, but it is unrelated to where the radio VFO is tuned to... that peak does not move when tuning the radio, in other words... I hear virtually nothing. And as I said, I get what seems to be no power to the external VFO.

I have disconnected and reconnected all the cables to and from everything thinking perhaps the cables had been made loose or something, but this has had no effect.

Any starting point for investigating this or these issues would be greatly appreciated.

Thanks in advance,

Paul

From: jstoneback@...
Topic: 55065 Message: 55065

Well I took out the YK-88C-1 and will look for a YK-88C.

With just the standard SSB filter(s), when I turn the VBT full CCW to Narrow, I have to adjust the IF shift to 9 o'clock to center a CW signal. This seems to work fine, but is it normal?

73,

Jim K4AXF

Hi Mike

Thank you very much for your help. Yes my mistake on the freq change, when I key down on CW as an example the freq display will change from 14.299.0 to 14.299.9 similar to the 800hz you mention. I have only recently started using the radio for CW so its quite likely that I just didn't pick up on this before.
I've had another look this evening and when in TUNE mode there is no IP reading on any band. On 10m in TUNE mode the ALC reading rapidly falls from a low value to near zero and negligable RF power out on CW.

many thanks & 73Laurie G0LTG

Laurie,

Repeat the initial tuning process but on 40 meters then watch the ALC
meter in TUNE mode to see if it drops back towards zero which I suspect
it will then replace the driver tube.

I was a bit vague on my last response.

Repeat the initial TUNE mode DRIVE control transmitter tuning for an ALC meter peak indication but do it on 40 meters. If the peak ALC meter indication in TUNE mode starts to drop back "on its own" toward zero then replace the driver tube.

From: Laurie J
Topic: 55059 Message: 55073

Hi Mike
Thanks again for your reply, I took a look today on 40m and the ALC peaks at about half the full scale and falls back slowly but not to zero, the same with 20m. I have ordered a new driver anyway because the readings on 15m seems to have suddenly started to drop off significantly as well. It should arrive on Friday and I'll be able to check for sure if it is the culprit.

many thanks and 73Laurie G0LTG

On Wednesday, July 13, 2016 8:18 PM, "Mike W5RKL w5rkl@... [TS-520_820_530_830]" <TS-520_820_530_830@yahoogroups.com> wrote:

Â Hi Mike

Thank you very much for your help. Yes my mistake on the freq change, when I key down on CW as an example the freq display will change from 14.299.0 to 14.299.9 similar to the 800hz you mention. I have only recently started using the radio for CW so its quite likely that I just didn't pick up on this before.
I've had another look this evening and when in TUNE mode there is no IP reading on any band. On 10m in TUNE mode the ALC reading rapidly falls from a low value to near zero and negligable RF power out on CW.

many thanks & 73 Laurie G0LTG

On Tuesday, July 12, 2016 8:02 PM, "Mike W5RKL w5rkl@... [TS-520_820_530_830]" <TS-520_820_530_830@yahoogroups.com> wrote:

Â Laurie,

The typical CW transmit frequency "shift" as seen on the digital display is approximately 800Hz which is normal. It's possible you may be reading the digital display incorrectly. Note the CW "receive" frequency indicated on the digital display. Next, key the transmitter in CW mode and note the "transmit" frequency indicated on the digital display. Subtract the transmit digital display frequency from the receive digital display frequency which is the CW transmit "shift" that is occurring.

There will be no transmit frequency "shift" when operating side band.

You say the 830 produces normal 100 watts output on side band on all band, slightly less on 10, that's normal. I am going to assume CW transmit produces the same 100 watts output on all bands, slightly less on 10 meters as well.

You said "there is almost no IP reading in TUNE mode on any band". You then said "IP seems to register normally under CW".

Do you have the meter switch set to ALC in TUNE mode?

Perform the following initial transmitter tuning steps:

1. Set meter switch to ALC
2. Set band switch to say 40 meters
3. Set Mode switch to TUNE
4. Set DRIVE control to 12 o'clock
5. Set CAR control between 10 and 11 o'clock
6. Connect the 830 to your 50 ohm dummy load
7. Power up the 830 and allow it to warmup for 30 minutes
8. Flip the SEND switch UP (Keys transmitter)
9. Adjust the DRIVE control for a peak meter indication, ignoring all meter scale. If the meter pegs fully to the right, rotate the CAR control CCW so the meter drops back to 12 o'clock or so, then continue adjusting the DRIVE control for a peak meter pointer indication.
10. Once the ALC peak meter pointer indication in TUNE mode is achieves, leave the transmitter keyed for a couple seconds longer while monitoring the meter. If the meter pointer starts to drop back towards zero then the driver tube is weak and should be replaced. If the meter peak remains stable, does not drop back towards zero, then the driver tube can be considered okay. I could be wrong but I suspect, at leas for now, the driver tubes is okay.

This is the initial driver adjustment for maximum RF drive to the final amplifier and a quick way to check the driver tube.

A "dead" driver tube has no control or affect over the final amplifier's 60ma idling current.

A "dead" driver tube has nothing to do with the CW transmit shift seen on the digital display.

A "dead" driver tubes would not produce 100 watts output, as you said, on side band and as I assumed also on CW.

73

Subject: [TS-520_820_530_830] VBT on TS-830s

Well I took out the YK-88C-1 and will look for a YK-88C.

With just the standard SSB filter(s), when I turn the VBT full CCW to Narrow, I have to adjust the IF shift to 9 o'clock to center a CW signal. This seems to work fine, but is it normal?

Jim K4AXF

55075. Weak marker signal on ts-530

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-14 06:09:49 UTC
From: benwestbrook@...
Topic: 55075 Message: 55075

Hey everybody,

I recently bought a nice ts-530s. Transmit is fine. However, I'm not sure the receiver is up to par. Signals are don't seem quite as strong as on my FTDX1200 using the same antenna. I have gone through the receiver tuning as instructed in the user's manual, and all the coils seemed pretty close to peaked. The receive may be okay, just seems a little down. The most obvious problem is that the marker signal is very weak. It's the weakest on 80 and 40 meters. It is strongest on 15 meters (about an s7) and much weaker on all other bands. Thought I'd see if anybody has any ideas.

Thanks
Ben, kc5hkw

55076. VFO-230 Optical Encoder

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-14 10:15:22 UTC
From: Ron W. Auld
Topic: 55076 Message: 55076

Has anyone ever tried to replace the optical encoder unit of a VFO-230 with something more modern? For example, one from Bourns like https://www.bourns.com/pdfs/ENC1J.pdf.
The Encoder Slit disk (Part # D09-0303-04) in mine was warped when I bought the unit a few months ago and is causing the dial to be erratic during part of the knob rotation. Replacement disks do not appear to be available, at least nothing turned up in a google search.
The other goal I have in mind here is that, if I select the proper "cycles per revolution" value, I can reduce the knob sensitivity.

Topic: 55065 Message: 55077

Again:

No CW filter installed.

When I turn the VBT toward full CCW (narrow), I have to adjust the IF SHIFT control to 9 o’clock to re-center the CW signal in I’m listening to. The manual seems to indicate that the center frequency should not move when advancing the VBT control. Is this an alignment issue?

I have no idea what the encoder in the VFO-230 is. You would have to study the VFO-230 schematic to determine whether the Bourns encoder will work. The Bourns encoder you are referring to has 5 pins but only "4" pins are used

VCC is typically +5VDC
Channel "A"
Channel "B"
GND

If I remember correctly the pins on the Bourns encoder are labeled Vcc, A, B, N/C, and GND. I would have to check the Bourns encoders I have to be sure. I plan on using them with my N3ZI DDS VFOs to replace the poor quality original encoders that came with the DDS VFO.

Ben,

For a properly aligned 530/830 you should be seeing s9 with the internal marker.
Subject to your ssh as a guide with ,-101db injected into the so239 you should see abt s3, this is only from memory.
I always do 3 passes of the coils when undertaking the alignment procedure.
You need to look at the service manual and check the receiver section on of 45 and check/ inject signals at the appropriate test point.

Thanks Mike. I've examined the vfo schematic and the data sheet for the encoder and it sure looks like it will work electrically. The biggest issue might be the actual mounting in place of the OEM unit. I was mainly interested to see if anyone had tried it and what, if any, problems they may have had. I'll probably order an appropriate Bourns encoder to test out the idea as I can do that without having to do any surgery to the VFO. If it works, then I can look at the mechanical issues and do a quick write-up to post if it works out.

Thanks for the response Dave. However, I don't have much in the way of test equipment, so no signal generator here. I had to use the internal marker signal (which was weak) to try to adjust the coils. I suppose I'll have to find someone with a signal generator to tune it properly. Thanks again, Ben, kc5hkw

Ben,
You will need some test equip to check the excruciating circuit. Perhaps a local club or Elmer.
You could first try tapping the relay on th board or gently removing and replacing Molex connectors.
I am currently at work do have limited information on voltages and test points.
The relay on the IF board is a huge source of problems.
The Inbuilt marker, will give a rough guide. Should see at least s9 or very close to it.

Ben
Once you find someone or obtain ssg, look at Terry's k9tw webpage on dbu/uv conversion. Easy to misinterpret the Kenwood measurements.

Hey everybody,

I recently bought a nice ts-530s. Transmit is fine. However, I'm not sure the receiver is up to par. Signals are don't seem quite as strong as on my FTDX1200 using the same antenna. I have gone through the receiver tuning as instructed in the user's manual, and all the coils seemed pretty close to peaked. The receive may be okay, just seems a little down. The most obvious problem is that the marker signal is very weak. It's the weakest on 80 and 40 meters. It is strongest on 15 meters (about an s7) and much weaker on all other bands. Thought I'd see if anybody has any ideas.

Thanks

Ben, kc5hkw

Again:
No CW filter installed.
When I turn the VBT toward full CCW (narrow), I have to adjust the IF SHIFT control to 9 o'clock to re-center the CW signal in I'm listening to. The manual seems to indicate that the center frequency should not move when advancing the VBT control. Is this an alignment issue?

Hi Holland,

The 6293 can be used in place of the 6146Bs but you will not see any increase in power output using the 6293.

While the 6293 has a life span much longer than the average 6146B, if you treat your 6146Bs properly, don't abuse them, push them for the very last watt output, they will last you a long time.

Here's some info on my TS-820 I have been working on for quite some time. On IF board TIF is 2.16v in rx and .63 in send. ALC is 2.66 v. High voltage is 850v. Hope I have these 6146 grid voltages right-grid #2 is 253v in rx and 238 in tx. Grid #3 is -93 in rx and -45 in tx. 12BY7 grid #1 is -37v, grid #2 is 246 v, and plate is 325 v. I don't have access to scope. Have DMM. What voltages should be coming out of RF board and where. What are some primary points I should check for voltages?

For the TIF signal it looks like you are measuring dc switching bias for D44. This is provided by RLT.

It is easiest and best to troubleshoot no ALC, no or low RF drive, and no or low RF output by running the TX Level Diagrams around pg 42 of your Service Manual.

Need to measure RF voltages and not DC. Would measure DC voltage when running TX Level Diagrams has narrowed and focused the fault to an area such as the TX Mixer. Need to use an RF probe with VTVM or DMM, RF Millivoltmenter, or O-scope. Best to have two RF probes. A single germanium signal diode probe to measure TIF level and a 3 diode probe to measure RF drive voltage at DP or Plate of Driver tube and at the Control Grids of the Finals.

KW runs TX Level Diagrams at 14.175mhz in CW mode with SG switch OFF. Can also be run on 40 or 80 if your RF voltage measuring test gear de-tunes the involved LC circuits too much.

TIF signal from the IF Board and at the RF board is around 35 rms RF volts.

Output of TX Mixer Q1/Q8 on RF board is approx 1.5 to 2.0 rms RF volts. Measured at MD or the Drains of the mosfets.

Output of the Driver tube is approx 65 rms RF volts. Measured a Pin 7 of the Driver tube or at DP (Caution must use 3 diode probe here as RF voltage level will exceed the signal diode PIV and burn it out).

Input to the Control grids of the Finals Pin 5 is approx 47 rms RF volts (again must use 3 diode probe). If you have -45vdc operating bias (that is low for 60ma resting plate current?) then any RF drive level less than approx 32 rms RF volts will result in no ALC indication in Tune Mode. Control grids must go positive with respect to cathode on positive going peak of the RF drive envelope to have any ALC indication. Will have RF output with 32 rms RF volts drive, but not normal.

Hello again from KG6DHQ

I recently replaced the finals in my 830 with a pair of used 6146W's from a ham swap meet. I went through the neutralizing process using the second radio method. The 830 was putting out about 85 watts on my Diawa SWR meter, key down on CW. Today when I went on 40 meters I had the following problem. LSB/IP shows 60 ma. Tune/ALC peaks drive at top of ALC scale. Tune/IP I can see a dip on the meter (on 80 meters). Going to CW/RF, send and key down...show no output on my SWR meter. HV shows about 850 volts. Going to "operate CW" Send/CW keying...no output.

What happened or what did I do wrong ? Bob, KG6DHQ

55096. DHQ again

Bob,

You said:

/"//Tune/IP I can see a dip on the meter (on 80 meters). Going to CW/RF, send and key down...show no output on my SWR meter."/

What level does the IP meter indicate with the 830 in CW mode and transmitter keyed after tuning the transmitter on 40 meters?

What position do you have the PLATE control knob initially pointing to for 40 meter transmitter tuning? The PLATE knob pointer should be pointing at a position along the solid white silk screen bar directly below the PLATE number "7".

What initial position do you have the LOAD control set to when you start the transmitter tuning procedure? The LOAD control should be set fully CCW? This will result in a more "pronounced" dip in IP current when adjust the PLATE control for a dip in IP meter indication.

You also said you swapped out the 6146Bs for 6146Ws. After doing so then neutralizing the final amplifier you notice there was no RF output. Did you remove the 6146Ws and put the 6146Bs back in then repeat transmitter tuning, ignoring final amplifier neutralizing for now? If not then you should do that.

Also, if you do not have an analog VTVM and RF probe then I recommend purchasing those 2 items. An analog VTVM with an RF probe will give you a better indication when neutralizing the final amplifier. There are plenty of inexpensive analog VTVMs on ebay and you can build a 3 diode RF probe (maximum RF voltage with a 3 diode RF probe will be approximately 90 RF volts) rather easily. The Heathkit IM-18 or V7a or V11 are good VTVMs to use. I've used all of them and they work very well.

I didn't have an RF probe so I built one. The picture below shows an example of my home made 90 RF volt RF probe. The only difference between the RF Probe I built for myself and the one shown in the picture below is the connector used to make connection to the VTVM. My probe has a 1/4" mono plug while the RF probe shown below has a "screw on" connector. I never cared for that screw on connector but the probe shown below was for an Eico 232 analog VTVM another ham had.

Bob,
Not normal. It is quite possible that you have a malfunctioning RL-1. RL-1 is on the AF-AVR board on the underside of the rig. This small relay controls LOTS of various functions in both RX & TX...and has caused loss of hair in some of us..hihi. The contacts are small and delicate and do not take kindly to being messed with. You can remove the cover and hit the contacts with cleaner...and them blow off with canned/compressed air...and see what happens...it may work and last for awhile and then come back..or it my not help at all. You can GENTLY tap on the relay cover with the eraser end of a pencil to see if you can induce a fault...BE CARFUL!!!! as you'll be doing this with the rig on...and you'll be very close to 900VDC. Ken Kemski k4eaa"dot" com has an excellent replacement for RL-1. I've used a couple and their GREAT!

Larry:

Just remember if it is a single diode germanium or schottky diode probe as most commercial RF probes are you will be able to use if for such common tasks as:
Product Detector carrier null, Balanced Mod LSB/USB carrier suppression balance, Final Tube neutralization, TIF signal measurement, Transmit Mixer output measurement, VFO output level adjustment, VCO level, Carrier Oscillator level adjustment etc.

However, you WILL NOT be able to use it to measure the output of the 12BY7A Driver tube or the RF drive at the control grids of the 6146 or S2001A Final tubes.

The only way you could use it to detect the presence of RF at the 6146 final tube control grids would be to set CAR Level pot full CCW, connect RF probe to control grids, slowly advance the CAR Level pot CW until you read no more than approx 30 rms RF volts. This would tell you that you had RF drive to your final tubes, but wouldnt be able to tell if you have enough for ALC indication.

I woudnt use the probe in this manner unless you know for certain what signal diode it uses as you risk burning out the diode. At 30 rms RF volts the reverse voltage that your probes diode is seeing is approx 30 x 2.83 = 85 volts. A 1N270 has a PIV of around 90 volts. A 1N34 has a PIV of approx 65 volts. Kiss the 1N34 good bye!

When you obtain your probe and if you need help running TX Level Diagram come back and ask.

I would never load to 280 ma. Have you read the loading instructions in your operating manual? It clearly states not to exceed 265 ma.

I doubt the voltage doubler B+ supply could supply 860vdc at 280ma. I suspect that your cathode resistors have drifted high in value giving you a false high Ip reading.

I would shut down and measure them.

No Bob, 280ma IP current is too high. The TS-830 operator's manual tells you the maximum IP current should be 250ma not 280ma!!

I mean no disrespect to Bob or anyone. Bob, have you spent time reading/studying the entire operator's/user's manual for the TS-830 so you understand how to properly and safely operate your TS-830? If not then I recommend you do that. Reading/studying the operator's manual is a step that many KW and other ham gear owners tend to skip or ignore. Reading the entire manual, not just certain pages, is a must. If there are topics that you do not understand what the manual is telling you, come here for help, don't ignore or skip over areas in the manual you don't like or don't understand. Quite often "operator errors" do occur because the operator failed to read and fully understand what's stated in the operator's/user manual.

I have a video on my website where I show how the 830 IP meter circuit works. You can access the video by clicking the following link:

http://w5rkl.com/wp-content/uploads/2015/02/TS530-TS830-Cathide-IP-meter-circuit.wmv

For those who have the TS-520 and TS-820 hybrids, I have a video that shows how the IP circuit in those 2 KW hybrids models work, simply click on the following link:

http://w5rkl.com/wp-content/uploads/2014/03/TS520-and-TS-820-Cathode-circuit-calculations.wmv

Date: 2016-07-17 22:25:29 UTC
From: Mark Gilger
Topic: 55109 Message: 55109

Net Info:
Saturday: 7.235 @ 3:30pm Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

The net started its existence on November 1st,
2011. The yearly check-in totals are posted at the bottom of this message.

The Saturday net was run by Mark, WB0IQK.Â There
were 5 stations checking in under poor, POOR,
POOR band conditions. There was 1 new station checking in: KM4RFP.

We had the following number of radios checking in.

1 running TS-520(x)
0 running TS-530(x)
1 running TS-820(x)
1 running TS-830S
0 running TS-510
0 running TS-511
0 running TS-515
0 running 599 twins
0 running TS-900

I was running my TS-830s and Drake L-4B amplifier.

The Sunday net was run by me, WB0IQK. There were
14 stations checking in under very poor band conditions.

We had the following number of radios checking in.

1 running TS-520(x)
1 running TS-530(x)
0 running TS-820(x)
4 running TS-830S
0 running TS-510
0 running TS-511
0 running 599 twins
0 running TS-900Â

I was running my TS-520s + Drake L-4B amplifier.

We have been having several people checking in
regularly with their TS-430, TS-440, and TS-940s,
which of course is not a hybrid, although over

30+ years old. Everyone is welcome as long as
they have an interest in the older equipment.

If anyone would be interested in filling in as a
net control station, please send me an email.
Currently it's just myself, and Jimmy, WB2KNR . I
would like to get several more. If we do, we can
alternate so everyone might be on a 3-4 week
rotation. It's a lot of fun and a good way to
make sure you station is optimized.

For anyone that has not heard, we have a new web
site that WB4HFN is hosting. He currently has a
very nice site for Drake, Collins and Heathkit
and now Kenwood Hybrids. Good quality manuals
plus sale flyers and brochures will be found
here, along with user supplied information for all Hybrids.

His URL is:
<http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm>http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012Â Saturday total 754
check-ins, Sunday tootal 563 check-ins
Nov. 2012 - Oct. 2013 Saturdays total 828 check-ins, Sunday total 609 check-ins
Nov. 2013 - Oct. 2014 Saturdays total 842 check-ins, Sunday total 744 check-ins
Nov. 2014 ☐ Oct 2015 Saturdays total 962 cheeck-ins, Sunday total 669 check-ins

November 2015, Saturday net total = 66, Sunday total = 46

December 2015, Saturday net total = 55, Sunday total = 73

January 2016, Saturday net total = 129, Sunday total = 81

February 2016, Saturday net total = 98, Sunday total = 72

March 2016, Saturday net total = 74, Sunday total = 35

April 2016, Saturday net total = 101, Sunday total = 57

May 2016, Saturday net total = 51, Sunday total = 32

June 2016, Saturday net total = 39, Sunday total = 46

July 2016, Saturday net total = 32, Sunday total = 27 (Month to date)

Running in circles...This time following the instructions in the Kenwood 830S Manual, for tuning the transmitter, the following occurred.....

In the tune position, adjusting the plate and load, my Diawa SWR meter shows about 20 watts out. When I go to the final step, switching to CW, there is no output on my SWR meter.

HV is about 840 v on the rigs meter, 130 ma in the tune, and 75 ma in the CW position.

SO, I have low output in the tune position and no output in the CW position.

I wonder if you hear the CW side tone when you hold your key down? That side tone indicates you are generating a Carrier in the CW mode. If you hear no side tone check to see if you have a good contact closure getting to the Key jack on the radio. A simple ohm meter check should show a short when you press the key down. There is supposed to be a contact closure in the actual physical key jack when there is nothing plugged into it, but sometimes the spring tension goes out of that contact or it gets oxidation on it. . My radio is Ham Radio...CW is Real Radio 73, John...K8JD

Welcome to the group, and to Ham radio.

Do you have a local Ham radio club in your area? If there is, get in touch with them; they will help you get your license, and deal with the change in equipment....

A plea, from all of us I think. DON'T just do the "memorize the test bank" bit. Electronics, and knowing something about it, will go a LONG way toward making Amateur radio a fun hobby. You get more out of it when you understand what is going on inside, rather than just being an appliance operator. ANYBODY can push a button. Knowing what button to push, and why, makes things a lot better all around.

It will also put your TS-820 "IN YOUR LEAGUE." It's rather satisfying to be able to repair your own gear. (I'm in the middle of a 1954 Allis-Chalmers WD-45 tractor, so it isn't just radios with me. And NO, it isn't for show. It's still very much a working machine.)

By the way, 41 lbs. is nothing. Try the weight of a TX-1 "Apache" transmitter, which was a very popular Heathkit model, on for size - 106 lbs.. You built them from a kit of parts, ordered out of a catalogue. It often herniated the mail man when they delivered the box of parts to your house.

I do miss those days.

Welcome to the hobby... bear in mind that the radio you purchased is an HF radio, and cant be used (in transmit) till you get your General Class license, except on some area of 10m for CW...

That said, I love my TS-820S, and use it frequently.

And I would add to what Wes said that learning to operate a rig like the TS-820 will help you learn a great deal about what button does what on more modern rigs, as you will have to actually understand that to make the most of your Kenwood. for example, so many new comers to the hobby turn their RF Gain up to the max and leave it there, and then just push noise reduction buttons to clear out some noise. With your radio, you can clear out a good deal of noise with the RF Gain... understanding how this radio works will make you a far better user of appliances when you decide to go get yourself a more modern rig... bt in my world, I have never sold a radio, and so still have my Kenwood TS-820S, my Drake TR-4C, and many others... there is something wondrous about those old rigs.

Again, Welcome!

And good luck on your exams.

Low power in the tune position is normal. When you switch to CW, you have to key it to have output power. Then adjust the tune and load for about 100 watts. It's best not to leave the key down too long.

Yep, I can say the Apache TX1 and the Marauder HX-10 are both rather heavy vintage transmitters. The Apache TX-1 weighs in at 105 pounds and the Marauder HX-10 weights in at 85 pounds. I have both transmitters and needless to say you don't move them around the operating desk very often. Using these transmitters, including the early DX-100/100B, require a desk that can support a minimum of 300 pounds.
James, as for studying to become an Amateur Radio operator, I agree, you should NOT follow the route a lot of other hams have done by "memorizing the questions/answer" in order to pass the test.
The TS-820 is not a CB radio where you turn it on, press the microphone PTT button, and start yakking. You must learn how to operate the 820, know what each knob's function is, how to proper use the knobs, and how to tune the transmitter. You can only learn this by spending time reading/studying the user manual and asking questions. If the TS-820 user manual was not included with the TS-820 you purchased, you should and can download it from my website
http://w5rkl.com/wp-content/uploads/2014/04/TS-820S-Operators-Manual.pdf

Download AND spend time reading/studying the FCC Part 97 Rules and Regulations that govern Amateur Radio in the U.S. and it's territories. Save the part 97 pdf file on your computer. YOU, the licensed Amateur Radio operator, is responsible for how your Amateur Radio station operates.

While today's CB doesn't require the operator to identify his/her station using a call sign assigned by the FCC, Amateur Radio and the FCC does require YOU to identify your station using your licenses class assigned call sign at the end of every communications and at 10 minute intervals during the communications (FCC part 97.119 STATION IDENTIFICATION). You should download and spend time reading/studying the FCC part 97 Rules and Regulations that govern Amateur Radio in the U.S. and it's territories. You can download part 97 at the following link.

http://w5rkl.com/wp-content/uploads/2015/02/FCC-Part-97-Amateur-Radio-Rules-and-Regulations.pdf

Once downloaded, save it to your computer so you can show it to an FCC rep if asked to do so.
A few ARRL books that will help you learn are
1. UNDERSTANDING AMATEUR RADIO2. SINGLE SIDEBAND FOR THE RADIO AMATEUR3. A COURSE IN RADIO FUNDAMENTALS4. ARRL HANDBOOK (EARLY EDITIONS, 1950s to 1980s)
Since you are studying for the exam, I recommend you use bppl #3 and #4 above, easily found on Ebay. There is book #3 on eBay ad #291500320619 for $9.99 plus $2.99 shipping right now. Books #4 are also available on Ebay, simply use Ebay's search text box using "ARRL HANDBOOK" as the search phrase. There's a 1977 ARRL handbook edition on eBay ad #122039809931 for $14.99 "Free Shipping" right now.

Once you have spent time learning BASIC ELECTRONIC and how basic receivers and CW transmitters work. then I recommend you obtain book #2, spend time studying SSB so you learn HOW SSB is produced in a SSB transmitter and how it is processed in a SSB receiver.

You cannot service a single side band transmitter/receiver if you have NO CLUE about SSB and how it works in a receiver and transmitter.

You get more out of it when you understand what is going on inside, rather than just being an appliance operator. ANYBODY can push a button. Knowing what button to push, and why, makes things a lot better all around.

It will also put your TS-820 "IN YOUR LEAGUE." It's rather satisfying to be able to repair your own gear. (I'm in the middle of a 1954 Allis-Chalmers WD-45 tractor, so it isn't just radios with me. And NO, it isn't for show. It's still very much a working machine.)

By the way, 41 lbs. is nothing. Try the weight of a TX-1 "Apache" transmitter, which was a very popular Heathkit model, on for size - 106 lbs.. You built them from a kit of parts, ordered out of a catalogue. It often herniated the mail man when they delivered the box of parts to your house.

I do miss those days.

The CW side tone does not indicate you are generating a CW carrier. The side tone can work fine but if VOX is NOT turned ON then keying and hearing the CW side tone does nothing. The TS-820 TUNE mode transmit will not produce 100 watts output. TUNE mode "reduces" the final tube 6146 screen voltage by approximately 45% resulting in a "lower" DC input power in the final amplifier. By reducing the DC input power in the final amplifier, the RF power OUTPUT is ALSO reduced resulting in less stress on the final tubes. Normal 6146 screen voltage is applied to the 6146 screens in CW and both side band modes.

Once the TUNE mode DRIVE control is adjusted for a peak ALC meter indication and the PLATE control is adjusted for a DIP in IP current, the MODE switch is changed to CW, the meter switch set to REL PWR, and the LOAD control is adjusted for a peak REL PWR indication. If a watt meter is connected between the transmitter's SO-239 and the load, hopefully the load is a 50 ohm dummy load, then the LOAD control is adjusted for a peak watt meter indication. Next, set the meter switch to IP and adjust the CAR control, if necessary, for a maximum IP current 200ma for the TS-520 or TS-820. There's no need to "readjust" the PLATE control for any further DIP. The final amplifier in the KW hybrids operate in Class AB1 that does NOT require an "IP dip touch up" after adjusting the LOAD control for maximum output as seen on the REL PWR meter or external watt meter.

Low power in the tune position is normal. When you switch to CW, you have to key it to have output power. Then adjust the tune and load for about 100 watts. It's best not to leave the key down too long.

James,
Also, welcome. Take some time to obtain the TS-820S Operating Manual and get familiar with the rig and it's controls. The manual is available for free from several groups members: Mike w5rkl"dot"com and n6wk"dot"com(Gordon is not with us any longer(SK). Obtain a dummy load capable of handling 100W to tune your rig into without radiating...a good amateur practice! I'll second the statement about actually learning and understanding some basic electronic theory and not just memorizing the question bank.
Also, Novice/Technician class license holders are permitted to use SSB phone on 10 meters-upper side band(28MHZ) between 28.300MHZ and 25.500MHZ...a real fun band...if and when propagation finally shows up!!

Greetings and Welcome, James!

This could be the beginning of the best phase of your life. Wes has given you some excellent advice.

And don’t be in too big of a rush to “upgrade” from that TS-820s. OK, you’ll most likely replace it with a modern rigs - most of us did that; but, in time, you’ll realize that the 820 was perhaps the finest rig you ever owned.

Best of luck, James.

The CW side tone does not indicate you are generating a CW carrier. The side tone can work fine but if VOX is NOT turned ON then keying and hearing the CW side tone does nothing.perate in Class AB1 that does NOT require an "IP dip touch up" after adjusting the LOAD control for maximum output as seen on the REL PWR meter or external watt meter.

Hey Wes,
Oh I remember the Heathkit catalogues, an hanging with my dad, years ago. I did have his old tube tester, but our last move it vanished. I my self have been a computer programmer analyst, electronics's is a hobby to me, I would rather fix it as to take it to someone and watch em turn a screw, or just spray cleaner, and pocket 100's,,,
Anyway, looking vary forward to HAM, been a CB'r for over 40yrs, about time I step up and get my license, my 90yr mother is working on her extra and my 65 yr old brother is extra, I guess runs the club out there northeast ks.
That's enough that is about it for a introduction. 73'rds

James

Out of my league, what a radio. Have to take down a CB antenna or
> two. What a difference in size and demands on pocket size....
> Looking forward to the next plateau,,,,,

Welcome to the group, and to Ham radio.

Do you have a local Ham radio club in your area? If there is, get in touch with them; they will help you get your license, and deal with the change in equipment....

A plea, from all of us I think. DON'T just do the "memorize the test bank" bit. Electronics, and knowing something about it, will go a LONG way toward making Amateur radio a fun hobby. You get more out of it when you understand what is going on inside, rather than just being an appliance operator. ANYBODY can push a button. Knowing what button to push, and why, makes things a lot better all around.

It will also put your TS-820 "IN YOUR LEAGUE." It's rather satisfying to be able to repair your own gear. (I'm in the middle of a 1954 Allis-Chalmers WD-45 tractor, so it isn't just radios with me. And NO, it isn't for show. It's still very much a working machine.)

By the way, 41 lbs. is nothing. Try the weight of a TX-1 "Apache" transmitter, which was a very popular Heathkit model, on for size - 106 lbs.. You built them from a kit of parts, ordered out of a catalogue. It often herniated the mail man when they delivered the box of parts to your house.

I do miss those days.

Subject: [TS-520_820_530_830] 830 no output

Running in circles...This time following the instructions in the Kenwood 830S Manual, for tuning the transmitter, the following occurred..... In the tune position, adjusting the plate and load, my Diawa SWR meter shows about 20 watts out. When I go to the final step, switching to CW, there is no output on my SWR meter. HV is about 840 v on the rigs meter, 130 ma in the tune, and 75 ma in the CW position. SO, I have low output in the tune position and no output in the CW position.

Bob, KG6DHQ

55128. How to leave a "yahoo groups" poor excuse for a mailing list

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-19 12:51:26 UTC
From: Wes Will
Topic: 55128 Message: 55128

In a web browser, go to

https://groups.yahoo.com/neo/groups/TS-520_820_530_830/management/membership

You will be required to log in with the username (email address) and password you set when you joined the Yahoo site. Since you seem to have a yahoo.com email address, it is likely the same one you use for that account.

Once on the "Membership" page, scroll all the way to the bottom of that web page and select the "Leave Group" option.

The email subscribe / unsubscribe links that once worked seem to be pretty much broken on all of the "Yahoo groups." It is not the fault of any individual group (including this one). It is simply that the Yahoo people are pretty much incompetent to run a bottle party at a distillery.

James,

You can download the TS-820 manual at my website

http://w5rkl.com/wp-content/uploads/2014/04/TS-820S-Operators-Manual.pdf

Most Turner 2 desk microphones will work with the 820 but you will need to insert a .01ufd 25VDC disc cap in series with the microphone element's Negative lead and ground otherwise the transmit audio will contain distortion. Yes there will be some soldering involved.

James, I would NOT start off with the ARRL Handbook... after your Technician exam, which is far less intense than either the General or Extra, pick that one only serve to confuse you at present... but once you get licensed and are working toward your General, go for an edition of the Handbook that covers the period of time your TS-820 was being manufactured, namely something between the late 1970s and early 1990s... these come out every year, and have information relevant to teh stuff and engineering of that time, for example, stuff about tube finals and drivers, where as the later versions will have less useful information about that stuff but far more on surface mount technologies, which are not present in your radio.

I highly recommend learning the material rather than memorizing it, as others have said... this is a key to the enjoyment of this hobby, and in point of fact, the TS-820 requires some technical skill and knowledge to use, and to maintain...

I am sure I speak for all here when I say good luck on the Technician Exam, and we look forward to your earning you General Class, so we can find you down the log on HF...

Hi folks..... Been a while since I bothered you.....
I just tried turning on my VOX control on my ts830......No go.... I just get a relay click every now and then while I turn the gain up or down. This does turn the audio off when the relay clicks but NO transmit..
NO response from microphone on any setting of gain...Usual question.... Where do I start to look..?? Where is the relay located??? Good to try replacing said relay??Thanks for any help you can provide.

Mike (KD2DYY)

James, If you get the proper plug that fits the radio, and know how to wire it (see user manual) ,you can use most mid to high Z mic element, as long as it converts sound into electricity it will work. My radio is Ham Radio...CW is Real Radio 73, John...K8JD

As I was troubleshooting (no display or fixed freq.) for the umpteenth time the counter board on my 830S, I noticed that C7 was running pretty hot, 45C. Let me also say at this point, that the board seems to be working well after touching up a few solder connections, but…

Even tho C7 checked good for ESR & value, I changed it out. Well the new one runs just as hot. And then I find Q14 & R10 are also hot. R10 is part of the supply voltage for many chips on this board along with C7 and a Zener). All the other chips/caps/resistors on the board seem to be near room temp.

So I began to check voltages on each of the 14 pins on Q14 & notice significant variations compared to another 830S set on the same frequency and all panel controls the same however C7/R10/Q4 run cool . Yet, both displays act the same as I transition thru all bands & frequencies.

Vdd pin 14 are close at 5.7 & 5.5VDC & Vss pin 7 are both the same at 0VDC. But I see a number of differences on other pins

So is is safe to assume that Q14 isn’t right, even tho the display works OK (most of the time)?

Thanx Bob W8RMV

The Turner 2 microphone will work with the KW hybrid.

Most hams wire the Turner 2 desk microphone using the 3 wires to the 4 pin microphone plug as follows:

PTT on pin 2
Microphone audio on pin 1
Ground for PTT and microphone element on pin 3

The "sharing" of PTT ground with the Microphone element ground, both connected to pin 3, can easily result in hum/distortion in the transmit audio. Quite often operators using a non-modified microphone wiring such as the Turner 2, are told there's RF being picked up by their microphone.

To prevent this, simply modify the microphone wiring in the base of the microphone by disconnecting the microphone element's ground wire from the PTT and microphone element ground which is typically the shield. Disconnect the microphone element's ground wire in the base of the microphone, connect and solder a .01ufd 25VDC disc capacitor between the microphone element's ground wire and the PTT ground, again which is typically the "shield". That eliminate/should prevent any hum/distortion on the transmit audio.

55135. TS-830S No Ip

Yahoo group: TS-520_820_530_830 (2015 — 2016)
Date: 2016-07-20 09:19:27 UTC
From: ckepus@...
Topic: 55135 Message: 55135

Couldn't sleep tonight so went to the shack about 1 AM to fire up the 830S. Was tuning up on 40 but didn't get past step 1.

I was on a dummy load, Made sure the Heater switch was "on", Switched to 7 mhz, set mode to Tune, Meter to ALC, CAR to 1 3/4, Switched on SEND, peaked the Drive to about half scale, Then switched Meter to Ip, Mode still in Tune, :Prepared to dip Plate, switched to SEND, no Ip to dip!! Nada...;

Since I hadn't used the rig for transmitting since April - it was putting out full output then...(used it for a lot in the meantime - of listening while getting a B LIne up and running)... figured I must have done something dumb so rechecked everything...exercised the switches, and tried again.

Same result. No Ip, High voltage normal.

What suggestions for me when I begin troubleshooting tomorrow?

Tnx / 73 / Chris / W7JPG

Chris, are you showing any output in tune?
If you are, go to cw and check your output, if your showing output and ip then more than likely R15/16, 56k half watt on rectifier board has gone out of spec or blown. I replace both with metal film half watt type.
Remember to disconnect from mains supply and allow for hv to discharge before attempting to work on radio.
Also be careful not to pinch any wires when screwing board back in
